Paragon Point No. 5.—ABSOLUTELY SELF CLEANING.

Both the inner and outer combustion chambers of the Paragon Furnace are self cleaning. That is, the upper and lower radiators are constructed in such a way that there really is no place for the soot to collect. The soot can do nothing else but fall back into the fire pot.

This point means that you do not have to pay a man every spring to clean the flues of the Paragon Furnace—and that the furnace is continually clean, and, therefore, in condition to do its best work.

MAGEE FURNACE CO.,

Boston.

ROUND OAK- STANDARD of AMERICA

CURTIS GANDY CHICAGO 1900

It takes very little work to sell a furnace of quality to the man who is throwing out a cheap furnace.

It would not have taken much more effort to have sold him the good one on the start. Trouble is—PRICE cuts entirely too much figure in the usual selling argument. It should be QUALITY.

WALKER BOILERS

FOR WATER OR STEAM.

The most powerful, economical and compact boilers made. They have given perfect satisfaction wherever installed.

The fireboxes are deep, and keep fire well. The grates are triangular, with rocking grates in the larger sizes if preferred. The flues are well arranged, and are easily reached for cleaning. The sections are united by push nipples.

We will gladly send catalogue, and solicit correspondence.

Walker & Pratt Mfg. Co.,

31-35 Union Street, BOSTON, MASS.

THE FINEST FACTORY IN THIS LINE IN THE WORLD.

the best cooking range.

You have heard of the Magee for years. If you are old enough you have heard of it for half a century. In all that time you have heard it praised for its large cooking capacity, for its small fuel consumption, for being so easily controlled, for being readily kept "bright and shining as the stars."

Magee Selling Points

The four things about a range that housewives most desire are those mentioned in above clipping from a circular that has been placed in the hands of many thousand housewives.

If Magee Ranges excel in these points—and there's overwhelming evidence that they do—shouldn't they be the most profitable line for you to handle? Do you require more convincing evidence than you now have? Write:

232 Quarry St., PHILADELPHIA. PA.

New Leader Furnace

POINTS OF CONSTRUCTION

A SH-PIT has great depth, with flush front.
Full sized door.

Grate in full view, making the removal of ashes very easy—not so with low ash-pit doors.

Not a square inch of solid substance to obstruct the draft, avoiding clinker formation.

Grate is easily taken apart as there are no bolts used. The cutting off of corroded bolts takes time and costs money.

By simply removing the plate in front of the cogs the bars can be replaced by unhooking them from the yokes. This is a new and desirable feature.

Feed Dome is made in one solid casting from fire pit to radiator and offers a large surface for the direct rays of the fire.

Fire Pot is made in two sections, heavy and particularly durable.

Dust Flue is placed in front of the furnace and extends from ash-pit to feed dome. It is large and has a damper.

Radiator is mounted with best quality refined steel.

5 SIZES:

20, 22, 24, 26, 28 in. fire pot.

Bright Idea Steam Boiler.

Nothing Equal to It.

It was Goethe, you recollect, who declared that "to find some one who thinks as I do strengthens my belief." Well, here's what one individual who has thoroughly tested the

GURNEY

"Bright Idea" Heater

thinks of it: "My house is large and exposed, but I can heat the whole of it with the mercury at zero outside. I believe there is nothing equal to the 'Gurney' for heating a house."

If such testimony were rare, of course it would carry less weight, but when we assure you that we have on file hundreds of letters of the same tenor, it seems almost impossible for you not to comprehend the excellence of the "Gurney" Heaters.

But, having comprehended it, why not make use of it? Become our agent and then you'll share its benefits. For just so long as merit finds appreciation, just so long are "Gurney" Heaters bound to sell in increasing numbers.

The Stanton Seamless Heater, PORTABLE CASED.

LOUISVILLE, KY., Apl. 5th, 1901.

THE STANTON HEATER CO.,
Martin's Ferry, Ohio.

Gentlemen:—Your favor of the 3d inst. is received asking our experience with the Stanton Heater which you put in for us during the fall of 1899. In reply we will say that it gives us pleasure to express our entire satisfaction with this Furnace. While we have had no severe weather this winter there have been several quite cold snaps, but our offices have been very comfortably heated, and our coal bill (Pittsburgh coal) has been quite moderate compared with other Heaters we have used.

The satisfaction the Heater has given us can be best expressed by saying that we have not heard the Furnace mentioned once this winter. You can see, therefore, that we have had absolutely no cause for complaint.

Yours very truly

ROBINSON-HUGHES & CO.

SEND FOR CATALOGUE.

THE STANTON HEATER CO.,
Martin's Ferry, Ohio.

See our advertisement next week.

It don't follow because you paid \$40.00 for a 22-inch pot Furnace that it is worth it. You might have got exactly the same construction under another name for \$34.50.

There are over sixty manufacturers making exactly the same type of Furnace; some have handsomer fronts than others, some have an extensively advertised name on the front, but the construction is just the same, and the handsome front or extensively advertised name don't add one cent to the real worth of it as a heating apparatus,

A 22-inch pot "Dighton" costs about one-third less.

A "Dighton" having a 20-inch pot is fully equal in heating capacity and more economical in fuel than any Furnace of the above character, will last longer without repairs, will give better satisfaction to your customer and greater profit to yourself.

At any price, from any concern, under any name, you can't get as much real Furnace value for the price you pay for it as we give you in the "Dighton."

BLAKE & ANDROS, Manufacturers, 28B Portland St., Boston, Mass.

A Tea Kettle Boils Quicker on my Chimney than on my Stove.

A fire in a red glow represents 1200 degrees of heat, a draft through this carries the heat out of the chimney unless intercepted by a cross tube **Rochester Radiator**, when nearly all this waste heat is conveyed into the room by the rapid circulation of air through the tubes and saved. This appeals to common sense and is verified by the most thorough scientific test.

The **Rochester Radiator** is a satisfactory article to sell and one that affords the dealer a good profit.

ROCHESTER RADIATOR CO.,

100 Furnace St., ROCHESTER, N. Y.

4,663 sq. ins.

WINCHESTER

How often success in man or goods is ascribed to "luck." We all know better. Intelligence, ability, diligence and merit make for success and not for failure. Do you suppose the "WINCHESTER" steam or water heater would have proved the success it has if it were merely "lucky"? Made by Smith & Thayer Co., Boston, Mass.

HEATER.

Burn Hard or Soft Coal, or Coke. Large Doors.

Some Ripe Experience

Has come to us through watching the doings of dealers throughout the United States.

We find that the dealer who sells cheap furnaces not only loses ground in the furnace business but also has a falling off in his other lines.

On the other hand we can say that the man who sells a good furnace and charges enough to do a good job will, in a few years, be the leading furnace man in his town and at the same time build up his other business.

The **American Furnace** is made for the better class of trade; is durable, clean and economical in fuel.

Furnace Heating.

A Practical and Comprehensive Treatise on Warming Buildings with Hot Air, by William G. Snow, with an Appendix on Furnace Fittings. 170 pages; size, 6 x 9 inches. Cloth bound. Price, \$1.50.

This is the only book that has been brought out which presents a systematic and reliable treatment of the warm air furnace system of heating.

It deals with the various types of furnaces, their construction, proper location and setting, together with furnace fittings, and all matters pertaining to the installation of furnaces and to effective and economical heating by warm air. The subject is discussed for the first time by a competent author possessed of a scientific education and a practical training, who presents positive rules, based on a long experience, for guidance in designing furnace systems for dwellings and other buildings where this popular method is employed. The various details of furnace work are described simply and at such length that the volume will be valuable to all who are in any way interested in the subject. It is recommended to practical furnacemen, to architects, builders and house owners, and to tinnerns and plumbers in suburban sections who do furnace work. To all these it will prove a reliable text-book and guide.

PARTIAL SUMMARY OF CONTENTS BY CHAPTERS.

Chapter I.—Furnaces—Is devoted to Furnace Construction—The Relative Proportion of Furnace Parts—Secondary Heating Surface—Economy and Efficiency—Heating Capacity and Exposed Wall Surface—Manufacturers' Ratings of Their Own Productions, etc.

Chapter II.—House Heating—Compares Furnaces and other apparatus, and describes Method of Setting Brick and Portable Furnaces—Location and Area of Cold Air Supply—Cold Air Rooms and Air Filters—Return Ducts and Air Circulation—Size of Hot Air Pipes—Location of Registers, etc.

Chapter III.—The Combination System—Discusses Heating Distant Rooms with Radiators—Balancing the System—Location of Water Heater in Furnace—Capacity of Water Heaters—Size of Radiators, etc.

Chapter IV.—Air—Deals with the Necessity of Ventilation—Water Needed to Moisten Air—Expansion of Air—Velocity of Air in Tubes, etc.

Chapter V.—Heating and Ventilation of Buildings—Considers the Size of Furnaces Required—Fresh Air Room and Supply—Air Circulation—Size of Flues—Use of Stack Heaters—Size of Heating Coils in Vent Flues, etc.

Chapter VI.—Heating of Public Buildings, Churches and Stores—Is given to the Size of Furnaces Required—Grate Surface in Ventilated Buildings—Air Supply—Size of Heating and Ventilating Flues—Size of Stack Heater, etc.

Chapter VII.—Fan-Furnace Combination System—Is devoted to Positive Warm Currents from Fan Systems—Location of Fan and Driving Apparatus—How Good Furnaces are Aided by Fans—Types and Efficiency of Fans—Area of Ducts and Flues, etc.

Chapter VIII.—Temperature Control.

Chapter IX.—Estimate and Contract Blanks.

Chapter X.—Value of Fuels. The Proper Size for Furnace Chimneys—with tables.

APPENDIX.

Furnace Fittings.—A section of 45 pages dealing with the Making of Furnace Casings—Metal Cold Air Boxes—Making Furnace Bonnets and Collars—Making Pipe and Elbows—Register Boxes and Stack Shoes, etc.

Sent postpaid on receipt of price, \$1.50.

A 62-PAGE PAMPHLET

Comprising a Series of
Articles and Letters on
*Chimney Troubles
and Their Remedies*
published under the title

Contains a compilation from the col-
umns of THE METAL WORKER, of arti-
cles and correspondence relating to
house chimneys, defective flues, and
kindred topics, comprising a source of
information of the most practical and
reliable nature, on overcoming difficul-
ties which occur in the working of
chimneys, flues, etc.

To all who are interested in flues
and drafts, in their relation to
stoves, furnaces and house heating ap-
paratus, this book will prove instruc-
tive and helpful.

The Contents are as follows

	Page.
POINTS ON CHIMNEYS . . .	7-32
An illustrated article by J. L. Bixby, Jr., describing many details in chimneys, which cause trouble, and giving remedies. An important table is presented, of the sizes of chimneys required in dwelling houses, based upon the amount of work to be done.	
DEFECTIVE FLUES . . .	33-35
This article presents information resulting from a wide, practical experience of the writer, and gives sound advice on some of the details of chimney construction.	
HOW TO IMPROVE A WEAK CHIMNEY	36-40
VARIOUS FORMS OF VENTI- LATORS or CHIMNEY TOPS	41-45
CONDENSATION IN STOVE PIPES	46, 47
SMOKE PIPE FOR WOOD FURNACES	48
REMEDYING DOWN DRAFT IN CHIMNEY	49-51
CONNECTED FLUES DESTROY DRAFT	52-55
FAILS TO BAKE ON BOTTOM	56-62

40 good Illustrations help
to make the Text clear.

KITCHEN BOILER CONNECTIONS.

A SELECTION OF

Practical Letters and Articles
Relating to Water Backs and
Range Boilers.

FIFTH ENLARGED EDITION.

194 Pages, 113 Illustrations, 6 x 9 in
Cloth Bound.

Price, \$1.00, Postpaid.

Press Notices of First Edition:

Can be considered an authority on the subject to which it relates.—*American Engineering.*

Nearly every problem is illustrated fully and this interesting question of water back connections will be found to be quite fully treated in the volume.—*Domestic Engineering.*

The *Metal Worker* produces in this volume a number of queries with answers thereto, which have appeared in that paper. It will be seen that any plumber who is troubled to make boilers work satisfactorily will here find his troubles alleviated. It contains numerous illustrations and throughout is highly practical from the standpoint of the plumber. It contains a table of contents and an index.—*Scientific American.*

If You Look at a No. 23 Candle

you will surely want it Any mechanic who occasionally finds it necessary to work or take a measurement in a dark place cannot help but be pleased with a No. 23. It produces a good strong light, can be carried where needed, may be set down or hung on a nail, can be lighted instantly and blown out when not needed, is absolutely safe, does not leak oil, nor has it any of the objections possessed by a candle, but will produce ten times as much light. Jobbers sell them everywhere; or we will send by paid express on receipt of 90 cts. in stamps or cash. Your money back if it does not please.

75 Cents Net.

CLAYTON & LAMBERT MFG. CO.,

200 Ruggles St., Boston, Mass.

TINSMITHS' HELPER AND PATTERN BOOK.

With Useful Rules, Diagrams and Tables. By H. K. VosBurgh.
Revised Edition, 120 Pages, 53 Figures, Size 4½ x 6¾ Inches,
Cloth Bound. Price, \$1.00.

We present a new and improved edition of this useful book, believing it to be one of the most important assistants to tinnerns and other mechanics that is published. The diagrams and patterns are now illustrated by means of new engravings, greatly improving the appearance of the book. The tables, rules and recipes have been carefully revised, these, with important additional tables, being printed from new type.

This edition is printed on fine paper, and bound durably in cloth, in a convenient pocket size.

The Tinsmiths' Helper is not intended to be a comprehensive treatise on sheet metal pattern cutting, which field is covered only by "The New Metal Worker Pattern Book," but it contains a collection of patterns of the most common occurrence, described in the plainest way. It meets the requirement of a simple hand-book for young tinnerns, and will be an invaluable aid to all sheet metal workers for the compilation of tables and rules alone. A list of the contents is given below.

DIAGRAMS AND PATTERNS.

To Find the Center of an Arc.
To Describe an Octagon Within a Given Square.
To Describe an Octagon Within a Given Circle.
To Describe Breasts for Cans.
Can Breasts.
Pattern for Cone.
To Describe Pattern for Flaring Vessels.
To Cut Hood for Stove Pipes.
To Describe Patterns for Flaring Tinware.
The Old German Rule for Patterns for the Cone.
Frustum of a Cone.
Flaring Vessel in Three Pieces.
Rectangular Funnel.
For Strainer Pail or Watering Pot Breast.
Scale Tray or Scoop.
To Find Length of Sheet Required for Oval Boiler. Common Method.
Oval Boiler Cover.
Measure Lip.
Steamer or Pitched Cover.

Heart with Square and Compass.
To Describe a Star.
Pattern for Cutting Bails. To Describe the Gores.
To Describe an Oval.
To Describe Oval with Diameters as 5 to 8.
To Describe an Oval. Two Other Methods.
To Describe Oval by Means of String, Pins and Peucil.
To Describe Pattern for Flaring Oval Vessels. Two Pieces.
To Describe Pattern for Flaring Article with Straight Sides and Round Ends. Two Pieces.
To Describe Pattern for Oval Flaring Vessel. Four Pieces.
To Describe Pattern for Flaring Hexagon Article.
To Describe Pattern for Flaring Square Vessel.
To Describe Pattern for Flaring Article with Square Top and Base a Rectangle. Two Pieces.

To Describe Tapering Octagon.
Flaring Article, Top and Base a Rectangle. Two Pieces.
Round Base and Square Top Article. Two Pieces.
Rectangular Base and Round Top Article.
Square Base and Round Top Article. Two Pieces.
To Describe a Square or Right Angle Elbow. Two Pieces.
To Describe Elbow. Quick Method.
To Describe Three-Piece Elbow.
To Describe a Right Angle Elbow. Four Pieces.
Elbow in Five Sections.
To Describe Pattern for Obtuse Elbow.
To Describe a Tapering Elbow.
To Obtain Length of Piece for Tea Kettle Body.
Mode of Stringing Patterns.
String Pattern.
Description of Boiler Block.

EPITOME OF MENSURATION.

Mensuration of the Circle and Its Sections.

Mensuration of Surfaces.

Mensuration of Spheres.

Mensuration of Cones and Pyramids.

Mensuration of Solids and Capacities of Bodies.

Mensuration of Cylinders.

Mensuration of Polygons.

TABLES, RULES AND RECIPES.

Table of Gauges of Black Sheet Iron.
Table of Weight per Square Foot of Iron Plates, from 1-16 up to ½ Inch Thick.
Rule for Finding Weight of Sheet Lead.
Table of Decimals Equivalent to the Fractional Parts of a Pound.
Table of Decimals Equivalent to the Fractional Parts of an Inch When Divided into 32 Parts; Likewise the Decimals Equivalent to the Fractional Parts of a Foot.
Table of Ordinary Dimensions of Galvanized Sheets.

Table of Weight of Galvanized Sheets.
Table and Rule to Ascertain the Weights of Pipes of Various Metals and Any Diameter Required.
Table of Weight per Foot of Lead Pipe.
Table of Net Weight per Box Tin Plates.
Table of Approximate Weight of Zinc Sheets.
Table of Relative Weights of Aluminum and Copper Sheets.
Tables of the Areas and Circumferences of Circles.
Table of Capacity of Cans 1 Inch Deep.

Rules for Calculating Circumferences.
Table of Weight of Water.
Table of Number of Barrels in Cisterns and Tanks.
Table Showing the Pressure of Water per Square Inch, Due to Different Heads, from 1 to 250 Feet.
Measures of Capacity and Weight.
Tables of Sizes of Tinware in the Form of Frustum of a Cone.
Table of Effects upon Bodies by Heat.
Practical Receipts for Solders, Cements, &c.

PRICE, ONE DOLLAR, POSTPAID.

David Williams Company, Publishers. 232-238 William St., New York.

There's only one Warm Air Generator.

THE KELSEY WARM AIR GENERATOR has been known by this name and so advertised for twelve years, and is manufactured solely by the Kelsey Furnace Company, Syracuse, N. Y.

The splendid results obtained with the "Kelsey" are becoming better known each year, and the demand for them has increased so rapidly that a certain firm or company, hoping to reap some of the benefits of the now famous "Kelsey," have used the term "Warm Air Generator" in connection with a heater they make.

The construction, however, of the Kelsey Warm Air Generator, being fully covered by patents, will be protected and cannot be successfully imitated.

**The Kelsey Warm Air Generator
will increase your business.** ♡ ♡

**The Kelsey method of warming
the air is the best method.** ♡ ♡ ♡

Building Activity in New York.

Judging from the reports of architects and builders, as well as from personal observation, the present year seems likely to be one of the most notable in the history of New York City as regards the erection of large new buildings; and also for the extent of the general building operations undertaken. The improvements now in hand, or lately completed, are not confined to any one locality, although they largely follow the general line of Broadway, and also cover the lower extremity of the city. The observer cannot fail to notice, in passing to and fro, the number of instances in which old buildings are being demolished to make room for more modern and imposing structures. He will also take note of the many cases where foundations are being sunk to bed rock by means of enormous iron or wooden caissons, as well as the many examples of steel skeleton frame construction that are rapidly mounting skyward. The many tall business buildings now going up will radically alter the sky line of the city. It is estimated that the amount of capital invested in buildings contracted to be ready for occupancy after the first of the coming May reaches the enormous total of at least \$30,000,000. A noticeable feature of the present building operations is the large number of high-class flats and apartment houses which are being erected in the upper part of New York, some of these being on a scale of magnificence never before attempted. These buildings, it is said, are no sooner finished than they are filled up with tenants. The remarkable increase in the volume of building operations in New York this year is illustrated in the statement that permits were taken out in the boroughs of Manhattan and the Bronx from January 1 to the middle of September for 2148 building improvements, estimated to cost over \$94,000,000. This compares with 1320 permits, for buildings to cost \$42,000,000, in the corresponding period of last year. It is very evident that building operations for 1901 will be on a much more elaborate and expensive scale than have been undertaken in any former year.

The Copper Situation.

The recent sharp drop in Amalgamated Copper Company shares following the passing of the extra dividend by the directors and a concurrent decline in the shares of other copper companies have attracted public attention to the condition of the copper market. For

some time past it has been felt by the trade that the price of copper in the United States has been artificial. The advance in copper about two years ago to the level of 17 cents per pound was justified then by an enormous expansion in the demand for copper all over the world, while the production at that time was increasing very slowly. The foreign demand, which has absorbed a very large proportion of the copper produced in this country, has been steadily declining during the past twelve months, while the home consumption has not expanded sufficiently to atone for the decrease in exports. Nevertheless, the producers have managed to maintain the price of the metal at the high level up to the present time. To the high price of copper is largely attributable the existing dullness in the market, because the domestic consumers are limiting their purchases to immediate needs, in the hope of a downward reaction in value, while foreign consumers are enabled to buy copper in Europe at materially lower prices than those ruling in this market. As an illustration of the falling off in the foreign demand for copper, it may be stated that our exports, which amounted to 90,747 gross tons in the first part of 1900, declined to 60,335 tons in the second half of the year, and fell to 50,027 gross tons during the first six months of the current year. In the meantime our production has remained stationary, being 134,577 tons during the first half of 1900, 134,404 tons during the second half and 133,394 tons in the first six months of 1901. Furthermore, the imports of copper have increased considerably, American merchants finding it profitable to import European copper rather than purchase the home product. As the domestic consumption this year has certainly not so far outstripped that of the corresponding period of 1900 as to make up for the radical decline in exports, the deduction is obvious that the large copper companies have been accumulating heavy stocks of the metal. This fact would naturally have a weakening influence on the market. Under the circumstances, it is fair to conclude that the maintenance by the great producers of the present level of prices will tax their resources to the greatest limit. Nevertheless, the conviction prevails that there will be no serious break in prices in the near future. The powers that rule the American copper market are believed to be abundantly able to maintain prices if they so decide.

The United States Steel Corporation.

In many respects the financial statement issued by the United States Steel Corporation for the first six months of their existence is extraordinary. The figures, showing average earnings of over \$9,000,000 per month, are higher than any who were not among the initiated had any conception of, and reflect the great prosperity of the iron trade at the present time. The fact that in August the earnings reached their maximum, although a considerable number of the admittedly most profitable plants were idle, may possibly be explained by methods of accounting. In various directions the splendid showing of the United States Steel Corporation will have its effect, but there is probably no single feature which is more commended in the business community generally than the

fact that so full and satisfactory an interim report has been given out. After some of the recent experiences with industrials, the course taken by the Executive Committee is commended by all.

Success in Advertising.

Government statistics are authority for the statement that the business men of this country are spending something like six hundred million dollars annually in advertising, and it is estimated that nearly one million business houses are regular advertisers. This statement suggests the magnitude to which this department of business has grown of late years. Thousands of men are now devoting their entire time to the preparation and placing of advertising matter and tens of thousands make a living by canvassing for advertisements. An increasing number of large concerns nowadays maintain an advertising department as a part of their equipment and pay handsome salaries to the experts who manage this branch of their business. In short, a new profession—that of advertising expert—has arisen, which offers attractive pecuniary prizes to those who succeed in it. There are few specialties to-day that are more valuable to the young man in business than a good working knowledge of advertising. The demand for well equipped advertising men is away in excess of the supply. To meet this demand a well-known Philadelphia business school has just instituted an advertising course as a new feature of its curriculum. It proposes to furnish to those who are employed or engaged in business pursuits during the day instruction in advertising by means of evening classes. The course mapped out is simple, yet thoroughly comprehensive, including a series of lessons and lectures designed to develop the qualifications essential to a good advertising man—namely, common sense, originality, power of expression and knowledge of human nature. To this should be added a thorough knowledge of the business to be advertised, without which efforts to secure public attention will lack that definite and practical character which is essential to the best results. In any instruction on this subject it should be prominently brought out that many of the popular attempts to catch the public eye, while striking and amusing, are very often unbusinesslike and grotesque. Much of the best advertising is done by men who are in close touch with the business, and without a professional training have developed a skill in this direction. In almost every concern, manufacturing or mercantile, large or small, there is an opportunity for the exercise of thought and skill in this field, inasmuch as good advertising contributes so largely to success in business. Practical knowledge in this field is good business capital.

Contracts With Time Limits.

A fruitful topic of discussion among the plumbing contractors of New York City at the present time is the trouble they are having in connection with contracts which they have signed for the completion of work within a specified time. A keen interest is felt in the subject owing to the inability of many of the contractors to meet the requirements of the time clause in their contracts, caused by the difficulty of securing some lines of goods which are very scarce in the market. This is particularly the case with some sizes of iron pipe, also with enameled bathtubs and other enameled goods, as well as several lines of specialties. Evidently those who had contracts to award had a better idea of the condition in the supply of such goods than some of the contractors, for in several instances they were unwilling to award the con-

tracts unless the supply houses consented to join the plumbers in a guarantee to supply the goods within the time specified for the completion of the contract. This has led to much hard feeling, and in some cases to threats that penalty should be exacted for the delay in fulfillment of the contract. In order to avoid trouble from this quarter some plumbers have made special efforts to secure the needed goods, even though they had to pay greatly increased prices for them, thereby reducing their profit to the danger line. In other instances, however, it was found utterly impossible to secure the goods and the owners were forced to delay the completion of their buildings. This condition of things has also caused the plumbers and supply houses who were behind with their contracts to make strenuous demands upon the manufacturers, in order that the former might be enabled to avoid loss. There are those who have but little sympathy for the predicament in which such contractors are found. They argue that careful business men are continually annoyed by those who are not only willing but eager to sign any form of contract, regardless of any clause it may contain that is likely to cause trouble or expense. There can be no doubt that, throughout the country, there are too many plumbers, steam fitters and sheet metal workers who are not careful in reading contracts and informing themselves of the full meaning of some seemingly harmless clauses. Under favorable conditions these clauses seldom lead to trouble, but they are always a menace in case any emergency arises, and should be stricken out or modified before the contract is signed.

The National Hardware Association.

The annual convention of the National Hardware Association, which takes place next week in Cleveland, Ohio, promises to be the largest gathering of that influential body yet held. The programme provides for the discussion of a number of subjects of interest and importance to the trade. Doubtless the deliberations of the convention will bring to the front many matters bearing more or less closely upon the interests of some of our readers. Many of the merchants composing the membership of the National Hardware Association are very large handlers of tin plates and sheet metals, as well as of goods used by the roofing, plumbing and heating trades, and the association embraces a tin plate and sheet metal section. It is obvious, therefore, that the views and actions of such an organization should be of interest to many in the trades represented by this paper.

One feature of especial interest connected with the coming convention is the fact that a call has been issued by a number of well-known manufacturers of the country for a meeting in Cleveland, at the time of the convention, to consider the advisability of forming an American Hardware Manufacturers' Association. While both the retail and wholesale hardware merchants are looking after their own interests more systematically and efficiently than ever before, by means of local, State and national associations, and have derived decided benefits from the same, there is certainly an equal reason for the formation of a manufacturers' association. With such an organization they would obviously be in a better position to meet anything like dictation, or to work together for the introduction of reform in trade usages, which, for the advancement of their own interests, or perhaps for the welfare of the trade as a whole, are desirable. There are many matters in which manufacturers have a concern which would probably come within the scope of such an organization,

such as terms of sale, classifying the jobbing and retail trade with reference to prices, questions concerning freight rates, classification, deliveries, &c. Besides this, such an association could undoubtedly do much in the direction of educating the less experienced manufacturers in proper business methods in the distribution of their products. With the recognized ability of the hardware manufacturers and the great interests they represent, an exceedingly strong and influential organization might be effected, which would have the respect and advance the interests of the trade at large.

In contrast with the phenomenal activity of labor in the United States is a report of labor conditions in Germany just sent to the State Department by the United States Consul-General at Coburg, which says that from all centers of mining, iron working and machine making in Germany come reports of short hours, dismissal of hands and cutting down of wages. For every 100 industrial vacancies the Consul-General says that there are over 160 applicants. The labor offices report an increased rush for positions, particularly by metal workers and those employed in the building trades. The outlook the Consul-General regards as very gloomy, as the depression in business in the German Empire is quite marked.

The annual report of the Massachusetts Bureau of Statistics, covering the year 1900, gives some interesting information about strikes in that State. Of the 189 cases of labor troubles occurring last year 10 were occasioned by questions relating to hours of labor alone, 28 to hours of labor and wages, 90 to wages alone and the remaining 61 were occasioned by a variety of causes. Of these 189 strikes 53 were successful, 10 partially successful, 25 were compromised, 74 failed, 14 were adjusted to the satisfaction of both parties and the balance were pending at the close of the year. Expressed in percentage, 28.04 per cent. of the contests terminated successfully for the employees, 5.29 per cent. were partially successful, 39.15 per cent. failed and 7.41 per cent. were satisfactorily adjusted.

THE TWENTY-FIRST OPENING OF THE NEW YORK TRADE SCHOOL.

The opening of the evening classes for the twenty-first year of the New York Trade School will occur on October 14. Those who are familiar with the school will find on approach that a new office building two stories in height has been erected on First avenue midway between Sixty-seventh and Sixty-eighth streets. The upper floor of the building will be occupied by a reading room, 40 x 50 feet in size. This will be well stocked with the various trade papers devoted to the trades taught at the school, as well as many valuable books of a technical and reference character for the assistance of the students. The first floor, which is to be used for the office, will be arranged to enable the superintendent, H. V. Brill, and his assistants, to more conveniently attend to the requirements of their work. The new building is provided with a vault in which valuable papers and the records of the institution can be conveniently kept.

A new and important feature of the instruction given in the school this season will be the raising of the standard which the students must reach in order to secure a certificate of proficiency. In future three evening terms will be required to complete the full course instead of one as heretofore. By this change it is hoped that those who take any of the evening courses will acquire a knowledge and proficiency at their chosen trade equal to that reached by those who take the day course, so that the certificates issued by the school will be awarded only to those scholars who are equally well informed and skillful.

The evening courses in which readers of *The Metal Worker* are most interested are those in plumbing, cornice and skylight making and the new course in wood pattern making. The day classes in plumbing and cor-

nic and skylight making open December 9. The day class in steam and hot water fitting opens on January 6.

Graduates of the New York Trade School have fully demonstrated their value in the various trades in which instruction is given at the institution, and each year finds at the close of the season, which this year will be April 9, 1902, tradesmen seeking to secure the services of some of the graduates. This is a tribute to the skill in handicraft and the thorough grasp of principles of their trades which the students acquire under the guidance of their instructors and through the lectures given by the superintendents of classes.

No one would have found greater pleasure than the late Colonel Anchmuty, the founder of the institution, in the facts that, on reaching its twenty-first year, the growth of the school has demanded a new office building, that a capacious reading room is to be provided for the pupils, and that the trustees have decided to require a higher standard of proficiency from those pupils who secure the graduating certificates. These evidences of its usefulness and progressive spirit are sufficient honor for the institution on attaining its majority. They hold the promise of a long career of broader usefulness.

Already applications for membership in the different classes are being made by young men visiting the school, and also by letter. Applications will be received until the opening day, October 14. Those who contemplate entering the classes will do well to secure a copy of the catalogue and to file their application at the earliest possible moment, as on several occasions in former years more applications have been received than the school could accommodate.

THE CONSOLIDATION OF HARDWARE JOBBING INTERESTS.

The question of consolidation among the jobbing trade continues to be a topic of engrossing interest among manufacturers and merchants. It is known that efforts in this direction are being made, and some of the facts in regard to the matter are coming to light, but in the main the whole thing is invested with an air of uncertainty and mystery which permits a great deal of conjecture in regard to the actual features of the scheme. There is also much discussion over the question as to the feasibility of any such project. Notwithstanding the fact that some men of prominence and ability are supposed to be active in the consolidation enterprise, the general feeling expressed by men whose judgment is entitled to weight is that an attempt to bring the jobbing trade together into a huge organization in any way that would give reasonable promise of successful operation is quite impracticable, and the project, as referred to in most of the public statements in regard to it, is characterized as visionary.

Whatever may be the outcome of the effort, the attention of the trade is thus brought to the fact that something in the way of consolidating jobbing interests is perhaps feasible. That there are an unnecessary number of jobbing houses is conceded, and the competition between them is such as to make it a difficult matter, under existing methods of distributing hardware, for them to realize anything beyond moderate profits, and in order to do this they must be given very efficient management. Even then the general course of the market has much to do with their success, which depends in too large a measure upon whether goods in their hands rise or fall in price. It is, however, exceedingly doubtful if anything in the way of consolidation is going to seriously diminish such competition. There is, perhaps, no reason why some of the competing houses should not join forces, and thus, perhaps, gain something in the way of economy and improved position. But in all this it must be remembered that no organization or artificial arrangement of any kind can be relied upon to make success in business. With the jobbing trade, as with every manufacturing and mercantile interest, the prime requisite is ability in management, which recognizes existing conditions and takes advantage of them with adequate skill and energy.—*The Iron Age*.

W. M. Shaddinger.

Washington McLean Shaddinger, who for many years was prominently identified with the Western stove trade, died in Chicago, September 20, aged 49 years. Mr. Shaddinger was born in Cincinnati, his father at the time being one of the proprietors of the Cincinnati *Enquirer*. He was named after the famous Washington McLean, then the editor of the *Enquirer*. He was engaged in the stove business for practically all of his adult life. His first connection was with N. Patterson & Co., and he was next in the employ of Redway & Burton, both of Cincinnati. Mr. Shaddinger then became connected with Fuller, Warren & Co. of Troy, N. Y., holding the position of assistant manager of their Chicago branch. Purchasing an interest in the Detroit Stove Works of Detroit, Mich., he was elected second vice-president of that company. In 1897 he was compelled to retire from active business on account of his health, which he never completely recovered, his death occurring from a complication of diseases. The remains were taken to Cincinnati, the interment occurring on the 22d. At the interment one of his old employers, S. R. Burton, was present, as well as Lazard Kahn of Hamilton, Ohio, they being the only representatives of the stove trade at the funeral. Mr. Shaddinger was a man of such wide acquaintance and was so highly regarded by his old associates in the stove trade that undoubtedly a large delegation would have participated in the last sad rites if information had been given them of his death. He was married while living in Detroit, and leaves a widow and daughter.

The Æolipyle Combustion Governor.

With a view to lending all assistance possible to those who sell heating apparatus and renew the smoke pipes to that already in use, the Æolipyle Company, 237 Water street, New York, are furnishing literature especially adapted for selling the Æolipyle combustion governors. One pamphlet, of 22 pages, is devoted entirely to testimonials from heating engineers, architects and the trade generally on the results that have attended the connection of an Æolipyle combustion governor with apparatus under their notice. Another pamphlet contains a price-list, pictures of the governor, and the method of attaching it to an apparatus, with a full explanation of how to operate it to maintain a uniform temperature in a building while accomplishing a saving in the fuel consumed. One cover of this little pamphlet is perforated along one edge, bearing on one side the address of the company and a space for the mailing stamp; on the other side there is room to make an appointment with a salesman, write a request for a full catalogue, order an Æolipyle, or request an examination of an apparatus, with a view to applying a combustion governor. Another convenient advertising device is a strip of paper 1¼ inches wide and 36 inches long, divided into ¼-inch spaces, and marked as a measuring tape. At various points are printed the prices of the different sizes of the Æolipyle Governor, and it is only necessary to run the paper around a smoke pipe in order to determine the price of a governor for the size of the pipe measured, whatever its size may be. The other side is divided into several sections containing text devoted to the advantages of the Æolipyle, among which is a statement that the United States Government is using 32 Æolipyle Governors on Government buildings at Fort Hamilton, New York Harbor.

CHARLES C. HEATH & Co., Baltimore, Md., are sending out a 16-page pamphlet calling attention to the merits of the National Furnace, which they manufacture in sizes adapted to meet varying requirements. The National is referred to as embodying the latest improvements, and in connection with the matter suggestions are given as to the proper method of setting a furnace. The company state that their 300 Series Furnace has a 20-inch steel radiator, high ash pit, strong, deep corrugated fire pot and sectionally revolving grate.

Andes Stoves and Ranges.

The illustrated catalogue for 1901, which has just been issued from the press by the Phillips & Clark Stove Company, Geneva, N. Y., is a very neatly printed volume of 132 pages, bound in maroon covers. In the early pages appears an excellent likeness of G. H. Phillips, together with a bird's-eye view of the company's plant. In their announcement to the trade, attention is called to the fact that all possible improvements in the company's products will be made as heretofore, and that the present high standard of Andes stoves and ranges, the result of over 50 years' experience in stove making, will be maintained. Within the past year they have originated many new patterns, so that the line presented within the covers of the catalogue is so complete that, as the company put it, "dealers in the Eastern and Middle States need not look elsewhere." The company's Eastern branch is located at Troy, N. Y., where a stock of ranges and repairs is always carried. For the benefit of the dealer some suggestions with regard to ordering repairs are given, together with terms and other matters likely to prove of interest.

The leading place in the catalogue is given to the Peerless Andes, a six-hole range of handsome exterior and embodying a new flue arrangement referred to by the manufacturers as a great improvement. The entire back of the oven is incased by the flue, so that the oven is thus in contact with more heating surface than is usually the case. The range is full size in every part; the castings are heavy, rich and massive, while the trimmings are chaste and appropriate. What is referred to as one of the best known of modern all cast iron French style ranges is the Monarch Andes, designed for using coal or wood and having six boiler holes in the top surface. It is made in 24 styles and sizes; has thoroughly ventilated oven, new improved concealed balanced springs, novel oven door latch, large hinged flue clean out, capacious reservoir and other features, which cannot fail to command the attention of the wide awake and enterprising dealer.

The cast stoves and ranges are represented by a varied assortment occupying something like 90 pages of the catalogue. The heating stoves are referred to as an assortment adapted to all sections of the country, some of which are for hard coal, some for soft coal, some for wood only, while others are arranged with combination of grates and fire pot linings to burn hard coal or soft coal, coke or wood. The leading place is given to the Art Andes, made as a single and double heater and having solid or sectional fire pot and duplex or draw center grate. Other heaters are the Revere, Crown, Mystic and Magic Andes, the Oak Andes in three styles; the Cottage Andes and the Rural Andes. The closing pages are devoted to price-lists, repairs, &c.

Catalogue of J. P. Lindemann & Sons.

A very comprehensive catalogue of attractive character, and comprising 100 pages, has just been issued by J. P. Lindemann & Sons, Milwaukee, Wis. The firm are Western representatives of the Co-operative Foundry Company of Rochester, N. Y., manufacturers of Red Cross stoves and ranges, and consequently a considerable portion of the publication is devoted to these stoves and ranges. The line is a very large one, comprising steel and cast ranges in great variety, cooking stoves, base burners, surface burning heaters adapted to all kinds of fuel, special stoves for soft coal, laundry stoves and hot air furnaces. The last half of the catalogue is filled with illustrations and list prices of the tinware, enameled ware and sheet metal goods manufactured by the firm. The assortment thus produced is a full line of sheet metal goods, including not only standard articles, but also the firm's own specialties, such as portable ovens for gasoline, gas and oil stoves. Lindemann ovens have a high standing in the trade, and not only comprise a great variety, but represent constructions suitable for every requirement. Several pages are devoted to oil stoves and sheet iron air tight.

Installing Furnace Plants in Old Houses.

BY M. L. KAISER.

The furnaceman is frequently called upon to estimate on placing heating apparatus in a house which has never had warm air partition flues, and no chimney available for smoke flue to the furnace except those to which the stoves were attached, and which probably do not extend to the cellar. Or perhaps the house was formerly warmed by fire place or Baltimore heaters, with slate mantel settings and solid brick or stone jambs in the cellar beneath.

In order to estimate intelligently on such work it will be necessary to plan the whole job in advance. To this end a plan of the house drawn to scale, and with the various doors in the proper locations, is a great convenience in locating the several partition flues or stacks. Such a plan is not absolutely indispensable, however, as the planning for stack locations may be done by measurement in the house itself. At any rate the householder will want to know "how you are going to do it," and will wish to be informed in advance how much replastering and repapering will need to be done, while the lady of the house will want to know how much dirt you are going to make and whether she must take up her carpets.

Unless these questions are answered promptly and satisfactorily the householder will invite Mr. Tongs, your competitor, to estimate on placing a steam or hot water heating plant, and have him tell how little dirt it will be necessary for him to make in installing his apparatus. Although you may be fully convinced that a good warm air job will be better for the house in question, it will avail you little unless you can give good and sufficient reasons for the faith which is in you. A confidence born of knowledge will go far toward allaying the fears of the prospective customer, and if he sees that you know much more about the subject than he does he will defer to your judgment in matters which may affect the efficiency of the apparatus.

OLD HOUSES CAN BE HEATED BY FURNACES.

At the outset of this paper the writer wishes to make the statement that there are few old houses containing up to ten rooms in which a perfect working furnace cannot be installed without marring plastering or papering and without removing the carpets. This statement is based on an experience covering houses of almost every description. If, however, warm air flues of sufficient size cannot otherwise be provided, there should be no hesitation in recommending and planning for flues of proper size in locations which will be the most feasible, and which will, when finished, mar the appearance of the room the least.

The loss of heat from a room by radiation and convection is governed by the material and construction of the walls, by the area of exposed wall and window surfaces, by the temperature of the adjoining rooms, by the difference in temperature between the outside air and the air in the room, and by the direction and velocity of the wind.

To provide for this loss and to maintain the air in the room at a constant temperature, it is necessary to introduce air at a temperature higher than the temperature desired in the room. The smaller the warm air flue or duct which carries this heated air, the greater must be the velocity and the higher the temperature of the air introduced to make up for these heat losses. A high temperature of the incoming air is undesirable, both from an hygienic and an economic point of view. The lower the temperature of the heated air the lower its velocity through the flue, and the greater must be the size of the flue and the volume supplied to replenish the loss of heat.

LARGE AIR FLUES NECESSARY.

Warm air flues of ample size should therefore be provided, and when a decision has been reached as to the proper size of warm air flue for a certain room nothing

less should be allowed to be substituted. Furnacemen should get rid of the fallacy that the warm air will be accelerated in passing an obstruction or through a constricted point in a warm air pipe or flue. The ordinary velocities of from 4 to $4\frac{1}{2}$ feet per second for first-floor flues and from 5 to $5\frac{1}{2}$ feet per second for second-floor flues means those velocities at the point of smallest area. The velocities apply for the ordinary working temperatures, and any increase in the velocity means an increase in the temperature to produce it.

It is evident, therefore, that with a velocity of 5 feet per second in a partition flue of 48 square inches area the velocity in the 9-inch round leader pipe of 64 square inches area will be a little less than 4 feet per second. If this same partition flue (of 48 square inches area) is restricted at any point so that the area is 36 square inches at the point of obstruction, then the velocity mentioned of 5 feet per second applies to the restricted point only, and the entire partition flue might as well be 36 square inches in area if friction is neglected. It should not be understood from this that the pipe should be of the same area from the furnace to the register, as the friction in the nearly horizontal leader pipe is greater

Installing Furnace Plants in Old Houses.—Fig. 1.—Method of Arranging for Side Wall Register.

than it is in the upright flue or stack. The power necessary to overcome friction is greater as the velocity increases. The horizontal pipes should therefore be one-quarter to one-third larger in area than the upright flue it supplies. If the difference is much more than this the loss from radiation from the increased pipe surface becomes so great as to offset the advantage derived from the increased area.

FLOOR REGISTERS.

The better way to provide the requisite area of warm air flues for the first floor is to place the register in the floor. The householder and his wife will sometimes refuse to consider the placing of floor registers, however, on account of the cutting of the carpets. The fact remains that by using a floor register the entire area of the leader pipe, whether it be 8 inches or 14 inches in diameter, may be made available, while the maximum available area with a partition flue placed in a house already built is reached at $4\frac{3}{4}$ x 12 inches for the first floor and $3\frac{3}{4}$ x 12 inches for the second floor. The objection that the floor register collects dust is also true of the wall register, as any one who has removed a wall register which has been in use can testify. The argument in its favor is that the floor register may be easily removed for cleaning, while the old people of the house will be quick to appreciate the advantage of being able to warm the feet over the floor register.

ARRANGING SIDE WALL REGISTERS.

To obtain the maximum area from $4\frac{3}{4}$ x 12 inches, or 57 square inches, for the first-floor partition flues, it is necessary to cut away the lath and plaster back of the baseboard, and let the asbestos covered tin pipe rest against the base board and finish with the finished wall surface. To make this effective there should be some means of so placing the register that it will not extend into the tin flue, as the flue would thereby be reduced in area just as surely as though the entire flue were the size of the space remaining. One way to accomplish this is to miter a 1 x 3 inch strip around the register

opening and nailed to the studding, with the bottom ends resting on the baseboard. The base mold may either be finished against the strip or mitered around it, as shown by Figs. 1 and 2. The face of the strip is flush with the base, and the register flanges rest against the strip at the top and sides and against the baseboard at the bottom. The edges of the strip under the register flanges should be covered with tin and asbestos. A convex register used in connection with this plan entirely obviates the obstruction of the flue by the register body.

One of the difficulties encountered is to find sufficient

Fig. 2.—Side View of Side Wall Register Connection.

space between the partition studding to provide the requisite area of warm air flues to properly heat the upper floors. While the upper floors require the less area of flues, it is usually more difficult to reach each of the rooms without marring the walls. Then, too, the studding is often "staggered" over the cellar joists, and quite as often the second-floor studding is staggered over the first-floor joists. In the first case the cellar joists may be cut and supported by headers, and if the condition exists at the second floor studding the flues or stacks may be turned over between the joists, and finished with a register and border in the floor. Where it is found necessary to place a header in the cellar joists, the joist may be most easily cut from above by sawing through a seam in the flooring. The nail which is driven into the joist at each seam in the flooring may be driven back out of the way of the saw with a nail set. A little sawdust and putty will effectually fill the saw cut.

CUTTING WOOD WORK.

The cutting of the wood work should be done before the measurements are taken for the warm air flues or stacks, as it often develops, after part of the cutting is done, that on account of some obstruction, before unseen, the stack must be located elsewhere than at first planned. For this same reason the furnaceman should do his own wood cutting, as by so doing a great deal of time and much unnecessary wood cutting may be saved. There is no reason why the furnaceman should not possess a good kit of wood cutting tools, and keep them clean and sharp, too. There seems to be a general opinion that the tinner and furnaceman cannot keep edge tools sharp, and this opinion is too often supported by facts. Every self respecting mechanic, whether he be tinner, plumber or carpenter, should take pride in keeping all his tools clean and ready for immediate use.

Opening a way through the partitions for the stacks is by no means a pleasant job, but care and good judgment will go far toward softening the unpleasant features. A large piece of old carpet to work on should be used in this, as in succeeding operations. Before starting to cut the wood work for a second or third floor stack the joists and studding on both floors should be accurately located, to make reasonably sure that the way is clear from bottom to top. The floor and the 2 x 8 inch plate may then be cut out from between the studding from the

cellar, and the space probed with a pole to make sure that there are no diagonal braces in the way.

REMOVING PLASTER KEYS WITHOUT DUST.

The flooring may then be cut out on the second floor and the upper plate cut away from above. The space between the studding at the top should then be plugged with old newspapers and the key of the plaster scraped off with a scraper, drawing downward. If scraped by drawing downward the key of the plaster is broken off flush with the inner side of the lath. If scraped by pushing upward the key is often broken away from between the lath. The purpose of the newspaper plug is to prevent the draft of air from the cellar from carrying the dust into the room. If the plug is allowed to remain in the opening the subsequent cutting may be done with very little dust, while if the plug is removed the draft will carry the dust far into the room. The floors should be cut against the joists, and along the seam at the tongue and groove by using a gimlet bit and fine keyhole saw, so that the boards may be removed and replaced without splitting. The stack or flue should then be made straight and square, and pushed up from the cellar in two sections, taking care to solder the sections together as they are pushed up, so that they cannot come apart if it is found necessary to draw them back. The stack should, of course, be covered with asbestos, pasted on, before being placed in position. If found necessary to remove the baseboard in order to open a way for the register head, it will sometimes be found that both ends of the base are "gained in" at the corners of the room. The base should then be pried out in the middle first and sprung away from the wall until one of the ends is free. The nails, instead of being driven back pre-

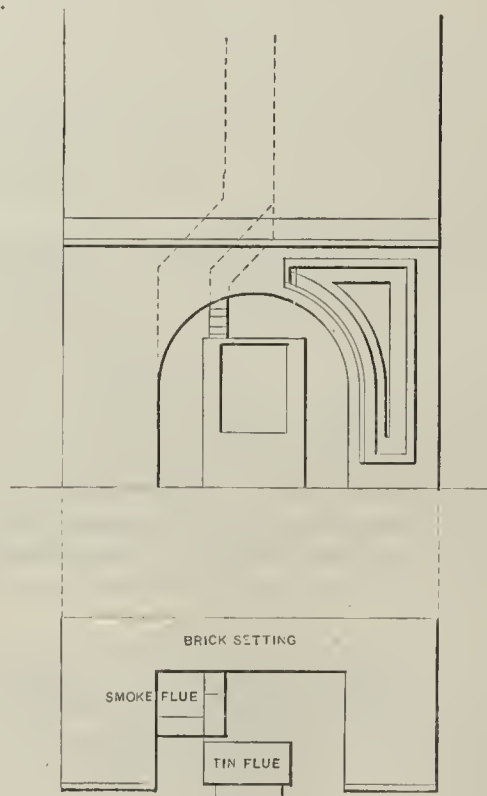

Fig. 3.—Plan and Elevation, Showing Smoke and Air Flue Substituted for Fire Place Heater.

paratory to replacing, should be broken off, so that the finish of the wood work will not be marred by splintering. Pieces of tin should be nailed around the stack in the cellar and above the ceiling, so that mice cannot use the openings as runways.

FIRE PLACE HEATERS REPLACED BY FURNACE.

If the house had formerly been heated by means of several Baltimore heaters, one of the settings may be used for the furnace smoke flue, and also for a register to the first floor room in which it stands. To accomplish this the brick hearth space between the jambs should be cut through and the 8 x 8 inch furnace flue built up from the cellar bottom against one of the jambs, leaving space enough in the center for the tin warm air flue, as in

Fig. 3. The front may then be tilted across or covered with an ornamental cast front. Where the Baltimore heater setting is not needed for a smoke flue, the tin warm air flue may be so arranged that two rooms on the second floor and one or two rooms on the first floor may be heated from it. The warm air flue at the bottom should, of course, equal in area the combined area of all its branches.

EXTENDING CHIMNEY.

It sometimes happens that the only chimney available for the furnace smoke flue rests on brackets in the dining room or sitting room, and extends only far enough below the first floor ceiling to receive the thimbles by which the heating stoves were formerly connected to it. In such a case the chimney may be extended to the cellar in the following manner: A short piece of 4 x 6 inch timber may be pushed through the pipe holes, with the ends projecting a short distance on either side of the chimney. Posts of 4 x 4 inch hemlock should then be

Fig. 4.—Method of Supporting Chimney While Building a Base.

wedged under each end of the short timber, the lower ends resting on the floor. Other posts should be placed in the cellar beneath these posts, to take the strain from the joists and flooring. The mason may then remove the brackets on which the chimney rests and start his chimney beneath it on the cellar bottom, first firmly bedding in the ground a thick flagstone about 8 inches larger in each dimension than the base of the chimney. The new chimney base may then be built up with cement mortar to meet the old chimney, building in at the proper heights the cast iron clean out frame and the galvanized smoke pipe thimble. The joint between the new and the old brick work should be firmly wedged with pieces of slate of the proper thickness. After allowing a few hours for the cement mortar to set, the props may be removed and the old smoke holes bricked shut. If carefully done it will be found that the old chimney has not settled a particle. See Fig. 4.

COLD AIR DUCT AND DAMPER.

It goes without saying that in such a plant as we are now contemplating the fresh air duct and furnace pit should be well constructed and of ample size to furnish all the pipes with a full supply of air. The duct should never be less than three-fourths of the combined capacities of the leader pipes, and the cut off valve should be so arranged that when the air is prevented from entering the furnace from the outside, it must enter by some other source of supply provided from inside the house. A tight damper which will close off the air duct completely or nearly so is an abomination and should not be tolerated. The furnace, too, should be considered as a ventilating as well as a heating apparatus, and

should be large enough to leave plenty of margin in the coldest weather. The air passages through the furnace should at least equal in area the combined areas of all the leader pipes. If the area of the air passages is much less than the area of the leader pipes some of the pipes will surely "go shy," while if the area of the air passage is greatly in excess of the areas of the leader pipes the air will pass through the furnace so slowly as to cause the casing to radiate considerable heat in the cellar. This is easily proved by shutting off a few registers while the furnace is well heated.

A RETURN DUCT.

If the house is pretty "leaky" and much exposed it is advisable to provide a return air duct with a register from the hall, and so provided with valves and levers that the same movement of the rod which shuts off the outside air supply will open the return air supply, and *vice versa*. The additional cost of such an arrangement is well invested, as it will enable the house to be quickly warmed in the early morning or in cold and windy weather. If the house is left locked up during the day the return air duct may be opened and the air circulated, thus providing a warm house with small fuel consumption. Although the house may be warmed at much less expensio by using the return duct, the householder should be warned that he is not getting the same results in ventilation as he would if he were using the fresh air duct. Heating by means of the return duct, however, is little worse than heating by direct steam or hot water radiation.

In conclusion it is well to remember what has been hinted at in the opening paragraphs, that such work as is met with in old houses must be estimated without the help of the architect's drawings and specifications, and there is, therefore, no architect on whom to place the responsibility. The furnaceman must do his own planning and must be responsible for the result. The effort should be to provide a first-class piece of work rather than to put in a cheap job. There are other arguments in favor of warm air heating as compared to steam and hot water heating besides the argument of lower price. Let the furnaceman educate himself first, and then educate his customers to the peculiar merits of his apparatus.

The ideas presented here are by no means exhaustive, but the purpose of this paper is accomplished if other ideas are hatched out by the inherent warmth of the subject.

Artistic Enameled Steel Ranges.

The Artistic Enameling Works, Ninth and Monroe streets, St. Louis, Mo., have prepared for distribution among the stove trade a little pamphlet in the interest of their Artistic enameled steel ranges. The text is written in an entertaining vein, and yet makes all the features of the range thoroughly understood. It is pointed out that the construction is such as to secure perfect operation; the oven is of ample size; the fire box equipment makes the care of the fire a simple matter; the high closet is capacious and well adapted for the use for which it is constructed, and the various parts of the range are enameled so that it can neither burn nor chip off, and moisture cannot penetrate it. Among the recommendations offered to the prospective buyer is the fact that no polishing of the range is required, consequently less dust is raised in the kitchen, and that the range can be kept clean and bright in appearance by scrubbing. Several comic pictures are presented, one showing a wife chasing her husband with a broom, because he refused to furnish her with an Artistic enameled steel range. In another the "lady help" is pictured saying, "I don't polish no range, mum," while in connection with a third a colored cook remarks that it "spoils her hands to be blacking them old-fashioned ranges." The last page of the catalogue shows a man in a happy state of satisfaction, due, it is said, to the fact of his meals being cooked on an Artistic enameled steel range. The company have an exhibit at the St. Louis Exposition, which is as thoroughly entertaining and attractive as this little catalogue which they are distributing.

Fire King Gas Heaters.

We show in the accompanying illustrations two forms of new Fire King gas heaters, which have been brought out this season by A. Weiskittel & Son of Baltimore, Md. The round heater, represented in Fig. 1 of the engravings, and known as the No. 1030 Special, is made with an ornamental cast iron top and base, with sheet iron

Fire King Gas Heaters.—Fig. 1.—General View of Round Heater.

drum. The burner is of the improved brass star pattern, the gas being taken into the center of the burner at the bottom. The tubing connection is on the stop cock, which passes through the base of the heater below the line of the burner so that the tubing is not affected by the heat, as is usually the case with gas heaters.

In Fig. 2 of the illustrations is represented what is known as the No. 124 Special radiator. This construc-

Fig. 2.—General View of Four-Tube Radiator.

tion is said to be of new design, has sheet iron columns set with jewels and Scotch tip burners. The manufacturers offer other styles of radiators having 6, 8 and 12 tubes, as well as a complete line of square and round gas heaters of every description.

FIRE of unknown origin damaged the plant of the Insurance Stove Company, on the Chesapeake & Ohio Railroad, between Fifteenth and Sixteenth streets, Covington, Ky., to the extent of \$2500 a few days ago.

Peninsular Stoves and Ranges.

A handsome catalogue and price-list is that which has been issued by the Peninsular Stove Company of Detroit, Mich., and which is known as No. 108. It is printed in colors showing, so far as possible, the nickel plated parts in contrast with the japanned and black iron surfaces of the stoves. In many instances the important constructive features are separately illustrated, while the descriptive text is of a character to render the construction and operation readily understood by the casual reader. The catalogue is oblong in shape, the size being such as to admit of the use of several illustrations to a page, instead of a single large one, as is often the case. The goods are offered under the generic name Peninsular and embrace styles and sizes adapted to meet requirements both large and small. The general makeup and arrangement shows a careful consideration of the requirements of the trade, and the volume as a whole is one which is likely to be preserved by all dealers into whose hands a copy may come.

ODD PLATES.

WE have received from J. H. Gluck, 218-222 North Gay street, Baltimore, Md., a package of circulars calling attention to the merits of some of the leading Cook Stoves and Heaters which he is prepared to furnish. Among these may be mentioned the Sterling Fortune, an attractive base burner and double heater; the Gluck Four-Hole Cook Stove, which is referred to as the culmination of 25 years of experience in the Stove business; the Orient Times, another four-hole cook, intended for using wood only; the Merry Bride, a handsome parlor heater made with direct draft or full revertible flue, and the Mars Single Heater, offered in a number of styles and sizes.

It is stated that negotiations have been completed by which the Pittsburgh Stove & Range Company of Pittsburgh, Pa., will centralize their various plants in Beaver Falls, Pa. We understand it is the intention of the company to locate the new works on College Hill, just north of the borough, the property consisting of a tract of 23 acres fronting on the Pennsylvania line. The new buildings are to be brick and steel with slate roofs and having a floor capacity of 17 acres. The contract to be entered into is said to provide that the Stove company will build the plant on the site, equip and operate it continuously for five years, or until it has paid their employees for 750,000 work days, and that the product of the concern will be manufactured in Beaver Falls exclusively. It is said that the plant is to be in operation within eight months.

THE GOBEILLE PATTERN COMPANY, Cleveland, Ohio, have issued a rather unique circular calling the attention of Stove manufacturers to the popularity of direct draft Heating Stoves, Hot Blasts, Cook Stoves, &c., which has been in evidence for the past few years, and which appears to be on the increase. The circular gives a list of some of the manufacturers who, the company state, have intrusted their ideas to them, and who have put on the market many successful Stoves for which the Gobeille Pattern Company made the designs and patterns. With regard to Steel Ranges they state they could fill a page with names of constructions from their designs and emphasize the fact that they take the crude idea and work it up into finished patterns. They also point out that they make no duplicate patterns.

THE RINGEN STOVE COMPANY, St. Louis, Mo., report a visit last week from C. Lehman of the Lehman Hardware & Implement Company of Newton, Kan., who placed an order with them for a carload of the well-known Quick Meal Ranges.

THE ROCHESTER RADIATOR COMPANY, Rochester, N. Y., are sending to the trade a circular and card well calculated to arouse interest in their Radiators for connection with the smoke pipes of stoves, furnaces and other heating apparatus. A legend on one side of the card reads: "This side is red and the other side we want read." On the other side are two pictures, one showing a tea kettle boiling on the top of a chimney, illustrating

the waste of heat, while the other depicts a young man sitting on the ridge of the roof holding his hand over the top of the chimney, showing how the waste of heat is prevented when the Rochester Radiator is used. In the pamphlet accompanying the card is a picture of the top of a chimney with dollar marks in red ink representing sparks of fire, and in the smoke the words "Here Goes $\frac{3}{4}$ " are printed. The pamphlet gives a thorough description of the construction and operation of the Rochester Radiator, and cuts show it in use connected with the smoke pipe of a stove on the first floor heating a chamber on the second floor.

C. W. BABCOCK, for the past 30 years with the late George Starrett, will be pleased to see his many friends and the trade generally at J. M. Litchfield's Mt. Penn Stove Works salesrooms, 105 Beekman street, New York, which is his headquarters now. Mr. Babcock is an expert on Stove Repairs of all kinds and will be glad to offer suggestions and impart information on intricate and generally unknown parts to the trade and others who are interested.

WE have received from the Economy Stove & Mfg. Company of Detroit, Mich., a 12-page pamphlet calling attention to the Real Economy Gas Range, for which strong claims are made. The design and construction are said to be entirely new, while the sizes manufactured are such as to meet requirements both large and small. The oven is lined with asbestos and has removable polished cast iron cake griddles fitted in the bottom. The fire is always visible and can be easily regulated from a standing position. The burners have drilled perforations, are removable for cleaning, and are so constructed as to produce, it is claimed, perfect combustion. The Stoves are made for both artificial and natural gas, those using the latter fuel being fitted with closed tops and solid covers, with an independent vent for each burner.

THE Western Stove trade continues very active. In fact, some of the managers of Chicago Stove houses go so far as to say that their business is "booming." This is a highly gratifying condition of trade, and it is earnestly hoped that it will keep up through the month.

THE MICHIGAN STOVE COMPANY are distributing a gorgeously illustrated publication entitled "What Others Think of Us," which contains a reproduction of articles printed some time since in *The Iron Age* relative to their foundry at Detroit and in the *Stoves and Hardware Reporter* relative to their Chicago branch house. Portraits of the officers of the company are given. The descriptive articles set forth the various processes involved in the manufacture of a Stove and the methods pursued in the management of the sales department. The book makes a handsome souvenir.

ON Saturday last, September 28, the Michigan Stove Company paid to their employees for 12 days' work the sum of \$27,754.64, being the largest sum ever paid out in wages by the concern during their existence. It is also believed to be the largest amount ever paid by any Stove concern in the world for a like number of days. The interesting statement is made by the Michigan Stove Company that the average cost of supplies reaches about the same sum as their pay roll.

It is stated that the Kelsey Furnace Company of Syracuse, N. Y., are about establishing a distributing depot in Nashua, N. H., in order to supply the Eastern territory. The company have secured a portion of the old bobbin shop on Charles street, where a stock of goods will be carried.

A RECENT ISSUE of the *Detroit Journal* contained a very interesting description of the plant of the Detroit Stove Works of that city, accompanied by illustrations of some of the various departments of Stove manufacture, together with general views of Jewel Ranges and Heaters. Stove manufacturing is one of Detroit's leading industries, and a description of the process of manufacturing always appears to be of interest.

THE ECONOMY STOVE & MFG. COMPANY of Detroit, Mich., have issued a 22-page pamphlet illustrating and describing the Economy Gas Heater, which they manufacture in many styles and sizes. All parts of the Stove which are exposed to the fire are of cast iron, as are

also the burners. The latter have an adjustable air mixer and are so arranged that they can be taken out through the bottom of the base for the purpose of cleaning without disturbing the filling or the basket grate. The Economy is fitted with a removable basket grate filled with patent incandescent fuel, which when lighted has the appearance of a hard coal fire. The Gas Heaters are made in 14 sizes and are referred to as being entirely new and up to date in all respects.

Family Rotary Nutmeg Grater.

The Specialty Mfg. Company, Lancaster, Pa., for whom Allerton-Clarke Company, 97 Chambers street, New York, are general selling agents, have just put on the market the Family rotary nutmeg grater, as here illustrated, which is improved in several respects as compared with the one formerly made. The grinding surface is made of heavier gauge metal and the support for the handle is also more substantial. The handle now, instead of being all wire, is cast metal, with a wire attachment fastened in the end of handle to keep the nutmeg continuously against the grinding surface until en-

Family Rotary Nutmeg Grater.

tirely used up. The whole device is tinned and made in a substantial manner, with a handle much more readily held than the former one.

Fuel Economizers

The stove trade will be interested in Catalogue J and a circular entitled "Why it Will Pay to Sell Burton's Fuel Economizer," issued by W. J. Burton & Co., 164 West Larned street, Detroit, Mich. The circular gives the prices, f.o.b. in Detroit, of the economizers to dealers and also to consumers, and a special concession to dealers when purchasing quantities. The printed matter enumerates the uses to which Burton's fuel economizer may be put and the advantages to be derived from it. By means of broken views the operation is readily understood. The catalogue shows the application of the economizer to smoke pipes of kitchen and parlor stoves, either for increasing the heat in the room in which the stove is set, or the temperature in the room above, when an economizer is placed there. It is claimed that it in no way affects the draft, but extracts the heat from the fuel to such an extent that roof fires and burning flues, are positively avoided. In construction the economizers are made of either polished or plain surfaced steel. They are attractive in form and neat in appearance through good workmanship. The weight is such that they can be readily removed from one room to another, and can easily be attached to the smoke pipe without the employment of a skilled mechanic. The stove dealer will find profit in studying their advantages and bringing their merits to the attention of his customers, as they are adapted for use in connection with wood and coal stoves, hot air furnaces and steam and hot water heaters.

A. J. MACDONALD has lately opened a store in Bainbridge, Ga., carrying a line embracing Hardware, Stoves, Agricultural Implements and Plumbing Supplies.

RETAIL STOVE DEALERS' AND SHEET METAL WORKERS' ASSOCIATION OF WILMINGTON, DEL.

Some time since reference was made in these columns to the fact that the firms engaged in the retail stove and sheet metal working trades in Wilmington, Del., were endeavoring to form an organization for the purposes of mutual trade protection. We have received from W. C. Johnson, of J. C. Johnson & Son of that city, who is chairman of the Committee of Correspondence, the following information respecting the Retail Stove Dealers and Sheet Metal Workers' Association of Wilmington, recently organized:

"The object of the organization is to secure united action upon matters of general interest to the trade affecting prices, charges for work and material, the bearing of wholesale dealers toward private consumers not in the trade, the relations of employees, and whatever else may prove helpful and protective, not alone to 'masters' in the trade, but to their customers and employees as well.

"Our membership includes, almost without exception, those conducting a stove and sheet metal trade in the city, and as the objects of the association are more clearly understood, it is expected that those few concerns not now included will join the organization. The beneficial effect of the organization is being already felt in an increased conviction of ability to maintain fair prices, in a more friendly feeling between its members, and in an interchange of information, which cannot fail to be helpful to all.

"The following motion has been adopted by the association:

Resolved. That the Retail Stove Dealers and Sheet Metal Workers' Association of Wilmington, Del., communicate with other associations of similar character throughout the United States in regard to the formation of an international organization for the benefit of the trade."

The officers of the association, elected at a recent meeting, are as follows:

President. Isaac S. Bullock.

Vice-president. Edward R. Davis.

Secretary. William J. McMahon.

Treasurer. George L. Stradley.

Stove and Hardware Dealers.

THE BENNETT HARDWARE COMPANY have opened a new store in Okmulgee, Ind. Ter. The line carried embraces Shelf and Heavy Hardware, Stoves and Tinware, Sporting Goods and Harness.

JAS. M. CAVANAUGH has lately established himself in the Hardware, Stove, Tinware, Farm Implement and Sporting Goods business in Kingman, Maine.

J. F. CHILES is successor to Chiles Bros. in the retail Hardware, Stove, Farm Implement and grocery business in Conway, Iowa. Mr. Chiles also conducts complete Harness and Tin shops.

McELROY & ZOLLINGER have succeeded McElroy & Lorenz, Vinton, Iowa, dealers in Hardware, Stoves, Tinware, Sporting Goods, &c.

B. N. TROUT has recently embarked in business at Juliette, Idaho, handling Shelf and Heavy Hardware, Stoves, &c.

LEIBSLE & TRUMBULL have succeeded H. F. Leibsle in the Hardware, Stove and grocery business in Conrad, Iowa.

S. A. A. WALKER has bought the Hardware, Stove and Tinware business in Gibbin, Neb., formerly conducted by L. J. Babcock.

BEARDSLEY HARDWARE COMPANY have succeeded Beardsley & Son, dealers in Hardware, Stoves, Farm Implements, &c. The members of the new firm are S. P. Beardsley, H. E. Beardsley and William Stuart. Their store has been enlarged and a stock of Buggies and Wagons added to the former line.

R. DOAK of Grenada, Miss., and T. W. Mackey of Wetumka, I. T., have formed a partnership under the style of Doak & Mackey, and will open up in the wholesale and retail business at Wetumka, I. T., about October 15. The new firm would be glad to receive catalogues and quotations from manufacturers of Hardware, Stoves, Tinware, Wooden Ware, Sporting Goods, &c.

F. B. CAMERON has commenced the sale of Shelf Hardware, Stoves and Builders' Materials at Lawton, Okla.

F. E. MYERS & Bro., Ashland, Ohio, in a circular under date September 26, call attention to the different lines of their manufacture, including Hand and Wind Mill Pumps, Power Pumps, Working Heads and Tank Pumps, Spray Pumps and Auxiliaries, Hay and Grain Unloading Machinery and Myers' Stayon Door Hangers.

THE W. BINGHAM COMPANY, Cleveland, Ohio, issue an attractively printed little book of 64 pages, which is referred to as not a catalogue, but intended more as a suggestion of what the company have to show the trade in their remodeled House Furnishing department, occupying the second floor of their establishment. Special attention is invited to their fine line of Cooking Utensils.

J. F. WATSON, Houston, Mo., has admitted his son to partnership, under the style of J. F. Watson & Son. The firm handle Shelf and Heavy Hardware, Stoves, Tinware and Agricultural Implements.

J. B. HARRISON has purchased the business of O. P. Cozatt, Afton, I. T., dealer in Shelf and Heavy Hardware, Stoves and Tinware, Agricultural Implements, Sporting Goods, &c., and will continue at the old stand.

C. H. BELL & Co. will shortly succeed the John Anderson Company, at Portland, Conn., conducting a Stove, Furnace and Plumbing business, and would be glad to receive catalogues from manufacturers of these line of goods.

THE store in the Elliott Block, Keene, N. H., formerly occupied by the Spencer Hardware Company, is being improved and refitted by Pearson Brothers, who will add a general line of Hardware to their Plumbing and Stove business.

THE STANDARD STAMPING COMPANY of St. Louis, Mo., have increased their capital stock from \$250,000 to \$400,000. The company have just completed a large and commodious five-story warehouse and storeroom, at 2000 to 2006 North Broadway, adjoining their present factory plant on the west. The general offices and salesroom will be located in this building within the next two weeks, it being the intention of the company to vacate their present store rooms at that time.

The Malleable Iron Fittings Company.

The Malleable Iron Fittings Company, Branford, Conn., have just completed and put in operation a large addition to their galvanizing and tinning department, which more than doubles the capacity of the plant. This is the second addition to that department in the last two years, in which time their custom galvanizing and tinning business has rapidly increased, as well as their output of galvanized malleable iron fittings. Being extensive manufacturers of malleable steel and semi-steel castings, and with a well equipped machine shop in connection with modern galvanizing, tinning, coppering and japanning departments, they are able to make arrangements to furnish castings, either malleable or gray, finished in any way and in any quantity. Their galvanizing department now has a capacity of more than 12 tons daily, and they give special attention to tinning common cast iron, using the well known W. T. Flanders' process, described in "Galvanizing and Tinning," a book published by David Williams Company, 232-238 William street, New York. They have acquired the patterns accumulated by W. T. Flanders in the last 15 years and used by him in building the many plants for galvanizing and tinning which he has undertaken, including those for his labor saving devices for pickling pipe and for preparing cast iron for tinning. They will furnish castings from them and will also furnish plans and estimates to those desiring to erect plants for themselves.

ANNUAL MEETING OF HEATING ENGINEERS.

At a meeting of the Board of Governors of the American Society of Heating and Ventilating Engineers, held at the office of the secretary, W. M. Mackay, in New York, on Friday, September 27, it was decided to hold the eighth annual meeting of the society at their headquarters at 12 West Thirty-first street, New York City, on Tuesday, Wednesday and Thursday, January 21, 22 and 23, 1902. A letter has been sent to the members announcing the date of the meeting and soliciting co-operation in making the meeting interesting and valuable to the profession.

The members are invited to prepare papers, or to suggest topics for discussion. It is pointed out that disappointment to members who cannot attend the annual meeting and disadvantage to the society have been felt in the past owing to the late date at which copies of papers were presented to the Committee on Publication, and members are urged to send in their papers earlier than heretofore. These copies should be in the hands of the secretary at least 30 days prior to the meeting. This allows the paper to be printed and distributed so that the members can read and be prepared to discuss it, also to give additional information regarding the subject treated, or to ask questions on points on which they differ. It is hoped that those members who favor the society by contributing papers will take the matter in hand early, so that the delay that has been a drawback to former meetings will be avoided at this meeting.

An announcement is also made that the ballot for a number of new members will be sent out this month. Members are advised that any candidate whom they intend proposing should fill out his application at once, in order that he may be elected in time to enjoy the full membership at the annual meeting.

A PLUMBER'S VIEWS ON PRINTING PRICES.

BY A READER.

If any one has a doubt on the subject, a little inquiry among grocers and dealers in other lines of goods will soon show him that the trade paper they regularly subscribe for furnishes them with the latest information regarding prices of all goods in their line. The idea that such publication is, or may be, anything but beneficial to him or his business has never entered the mind of any business man, except some members of the plumbing trade, who, by some process of reasoning unknown to the writer, have reached the conclusion that their business must be conducted along lines totally different from those followed in other trades. In other words, they refuse to believe that it is as necessary for the members of their craft to keep in touch with the market in which they buy as it is for dealers in other lines.

A little thought on the subject must convince any reasonable person that there is no item of news a trade paper can publish that is of more vital interest to the subscriber than the prevailing prices of goods handled by him. Many subscribers to trade papers never take time nor feel disposed to read anything they contain except the market quotations. These they make it a rule to read regularly, because it is to their interest to do so. And it is safe to say a large majority of subscribers to trade papers of every kind would discontinue the paper if it ceased to furnish them with accurate market reports.

The claim so frequently made that the publication of prices of plumbing goods will educate the masses to the kicking point is not borne out by the experience of those engaged in other lines. Ordinarily, people do not consult trade papers before buying goods of any kind. But even if they did it might be to the advantage of the plumber, for it is a question if his pathway would not be smoother if his patrons were to know more about the cost of plumbing supplies than they do. Every one who has had any experience in the trade knows that a general belief exists outside of the trade that the plumber derives a much larger margin of profit on materials than

he really does, and this belief is the cause of most of the disputes which arise over bills when presented.

But whether the plumber would be benefited or not in the event of his patrons being better posted, the fact is most apparent that it is desirable he himself should be well posted as to prices and not be compelled to rely on the traveling man, who, if so disposed, may quote a higher price than the condition of the market justifies. The traveling salesman, as a rule, is a good fellow and can generally be depended on to do the right thing. But it is to his interest to get as good a price as possible, and no one can blame him for doing so. Another fact to consider is that he is not always at hand when wanted for reference, while the paper is. It comes regularly and the prices it publishes are to be relied on, for the reason that it has no axe to grind. It only aims to be accurate.

Allen Automatic Air and Vacuum Valve.

Illustrations are herewith given of the Allen automatic air and vacuum valve, which has just been placed on the market by the Norwall Mfg. Company, 40 Dearborn street, Chicago. This valve is intended for either steam or hot water. Fig. 1 shows the valve open, and Fig. 2 shows it closed. It consists of a shell in which

Fig. 1.—Open.

Fig. 2.—Closed.

The Allen Automatic Air and Vacuum Valve.

the radiator outlet or inlet is so placed as to form a well in the lower half of the valve to receive and retain the condensation from the steam as it passes into or through the valve. A sealed copper float is placed in this well, and as the steam condenses the well gradually fills and the float ascends to its seat, effectually closing the valve. As the radiator cools when the steam goes down, or on closing the radiator valve, the surplus water in the well flows back into the radiator and the float drops. The pressure of the steam cuts no figure, the operation being the same with 1 pound or 50 pounds pressure.

The small loose pin in the top of the valve is the vacuum pin. As the radiator closes and the air seeks to enter the radiator to take the place of the condensing steam, the vacuum pressure causes the pin to seat itself and thus provides a positive automatic seal or check against air entering the radiator through the valve. This causes the radiator to cool much more slowly than it does with the ordinary air valve. When the radiator valve is again turned on or the steam is raised in the system, there being no air to expel none of the odor is noticeable, as in the case of radiators equipped with ordinary air valves, and besides the radiator heats almost instantly from end to end. The valve is specially valuable on radiators controlled by thermostatic radiator valves, as the slowness in cooling and quickness in heating add materially to the efficiency of the system.

The American Hot Water Heaters.

The custom of furnishing hot water to the tenants of hotels, apartment houses, office buildings and other institutions has led to the production of special apparatus for the purpose. The plant which generates steam for other purposes supplies either live or exhaust steam, which may be utilized for heating the water supply in connection with specially constructed water heaters. In Fig. 1 is shown the live steam water heater placed on the market by the Whitlock Coil Pipe Company of Hartford, Conn. It consists of a steel shell with two flanged heads riveted in place. For heating, a coil of seamless drawn copper tubing with brazed joints is used and rigidly fastened in position, being inserted through a

The American Hot Water Heaters.—Fig. 1.—Sectional View of Live Steam Heater.

suitable manhole provided in one head, while the ends of the coil pass through the other head. These live steam water heaters are made 18, 24, 30, 36 and 42 inches in diameter, and from 5 to 14 feet in length. The water connections and the steam connections vary from 1 to 2½ inches in diameter, according to the size of the heaters, which are rated to furnish from 150 to 2000 gallons of hot water per hour.

Fig. 2 shows the water heater when exhaust steam is used for the heating. These heaters are made in nine different sizes, varying in diameter. The diameters are 18, 24, 30, 36, 43 and 48 inches, the length varying from 5 to 10½ feet. In this heater the manhole is 11 x 13 inches in size and placed on the top side of the heater, while at one end there is a flanged steel head. At the other there is a double cast iron head, the inner head being drilled to receive the ends of the U shaped brass pipes, which are expanded into it. The use of the double head provides a chamber admitting of the use of steam supply pipes from 2 to 8 inches in diameter.

Fig. 2.—Sectional View of Exhaust Steam Heater.

These heaters are rated to furnish from 150 to 2000 gallons of hot water per hour.

In piping for hot water supply the company suggest that the main supply pipe should lead from the hot water outlet through the various parts of the building where hot water is to be supplied, and return either full size or reduced to the connection marked "mud blow." This makes a loop for providing a continuous circulation of water, so that hot water may be immediately drawn at any point. By the use of a tee and suitable valves this mud blow connection can be used both for a drain and a washout pipe. It is also recommended that a thermostatic regulator valve should be provided to regulate the steam supply in the live steam heater in order

to prevent the water from becoming too hot. Where economy is not a necessary feature such a device is not necessary in the exhaust steam heater. The company issue a catalogue devoted to these heaters giving full dimensions, particulars and prices.

Plumbing Regulations Criticised.

In a paper read by Wm. Paul Gerhard, C. E., before the annual meeting of the School for Health Officers, at Burlington, Vt., July 10, 1901, the plumbing regulations, held in the highest esteem by the plumbing trade, were subjected to the following criticisms. Greater interest will be given to them on account of the high opinion held of Mr. Gerhard as a sanitary engineer:

I have already had occasion to state that, in my judgment, even the most elaborate of plumbing rules are open to criticisms in many respects, and it might seem appropriate to close this paper by pointing out at least a few rules which, to my way of thinking, are disputed matters.

There is, first, the question whether or not the main house sewer should have a trap near the front wall of the house. It must be conceded that where the house pipes are known to be absolutely tight and are provided with plenty of ventilation to the roof it is better to omit the trap. This secures at least two advantages—namely, it does away with the tendency to stoppages in the trap, and it also offers the best possible solution of the difficult problem of how to ventilate the street sewer. It is of course necessary that the latter should be well planned, well constructed, well flushed and well cared for.

When a trap is used on a house sewer—and it does seem to be necessary in the case of foul street sewers or in the case of connections with cesspools—it becomes necessary to provide a fresh air pipe which enters the house sewer above the main trap, and which establishes a circulation of air throughout the entire house pipe system. The difficulty with the fresh air inlet lies in choosing a proper location for the same. This difficulty exists only in cases of city buildings, for in country towns and villages and for isolated country houses it is comparatively easy to select and provide a secluded place for the fresh air inlet at a sufficient distance from the house. In our cities we have for years been struggling with a sort of brick pit, or basin, placed near the curb, covered with a grating in which the fresh air pipe terminated. Practical experience demonstrated the utter failure of this device, and we have by no means found the best substitute for the same. In New York City, for instance, every house owner who builds or alters a house is at present compelled by the Building Department to use a new patented device which is not only very expensive but quite worthless.

Regarding the types of water closets which are permissible in houses I am by no means in entire accord with the plumbing regulations of most cities. In New York, for instance, iron water closets are absolutely prohibited by the rules, and yet I cannot imagine anything better, stronger or more adapted for factories, stables, railroad stations, schools, insane asylums, &c., than a good, well made iron flushing rim wash down or siphon jet closet in which the entire inside is well covered with porcelain white enamel.

Again, these rules prohibit the use of the so-called "long flushing rim hoppers" except in situations where the closet bowl holding the water would be exposed to freezing. As a matter of fact, I have had under personal observation for a great many years one of the best types of long flushing rim hoppers, and I must frankly say that, notwithstanding the fact that it lacks the advantage of a large volume of water in the bowl, it is, to my mind, one of the best closets of the present day. Of course it should be well used, and it should have a well regulated and plentiful flush.

The rules of many cities prohibit the use of automatic flushing cisterns for urinals, and require instead a flushing tank with a chain and pull device. We all know the great carelessness exhibited in the use of such fixtures and the negligence of the general public in flushing the same after use where the fixture is provided with a stop cock and a water supply pipe. While the rule appears

to be proper in cases where it is desired to limit the use of water or to stop reckless waste, I cannot see why an owner of an office building, for instance, who puts in a water meter on his service and is willing to pay the water bill in full, no matter how large, can be prevented from using such automatic flushing tanks.

Nearly all rules call for a separate trap under every plumbing fixture, the same to be placed as close to the outlet of the fixture as possible, and yet, in the case of a set of three or more washtubs, building departments have been known to object to a layout of the plumbing in which each of the tubs had a separate trap, which, according to my experience, is the best possible arrangement of such work. Again, in bathrooms of private houses, where there is a shower or needle bath alongside of a wash basin and no bathtub in the room, which certainly can mean but one thing, and that is that the occupant of said house or bathroom intends using the shower bath instead of a bathtub probably as frequently as if he had a tub, plans with such arrangement of fixtures have been rejected by the Municipal Building Department of New York City because each of the fixtures—namely, the basin and the shower bath, had a separate trap. Instead of this arrangement the Department required that the waste from the basin be run into the trap of the shower bath, “in order to keep it supplied with water,” yet by so doing a channel, or waste pipe, sometimes 8 or 10 feet in length and lined with slimy waste matters, is left untrapped and in full connection with the air of the room.

Where the rules permit the use of wrought iron for soil and waste pipes they require such pipe to be galvanized and exclude the use of asphalted wrought iron pipe, whereas, as a matter of fact, the asphalted pipe is much smoother on the inside than the common galvanized pipe, and asphalted properly done is probably a better protection against rust than the common method of galvanizing. Some rules I have seen permit the horizontal portion of the house drain to be asphalted wrought iron pipe, but insist upon the soil pipes being galvanized. It would be interesting to know the why and wherefore of such a rule!

Again, where wrought iron screw jointed systems are permitted the rules require recessed drainage fittings for the soil and waste pipes, but permit the use of ordinary steam fittings for vent pipes. It must be evident that if the recessed fitting has any value at all, it is just as desirable to use it for the vent pipes and particularly for the horizontal runs of the same.

The rules of most cities call for every building to have its sewer connection directly in front of the building. I well remember a case of this kind where there was no sewer at all in the avenue in front of the building, and where there was a private alley in the rear in which a sewer had been laid by the private owners abutting on said alley. When I filed my plans in the Department showing the house sewer to run to the rear to said private sewer, instead of to the front, where there was no sewer, my plans were promptly disapproved, and it required several hours' arguing on different days to convince the head of the Department that the sewer connection in the rear was just as good and certainly just as permissible as the additional outlay of money to which he wanted to subject the owner of the property by compelling him to build a private sewer in front of the house.

Other points in plumbing rules which were well meant when they were drawn have been unfortunately misunderstood and misinterpreted. Take for instance the rule requiring that every house sewer should be laid with an inclination of at least $\frac{1}{4}$ inch to the foot. This rule was intended to establish a minimum fall and it is quite obvious to any one who has at all studied hydraulics that the smaller the diameter of the pipe the greater its inclination should be, yet by common consent the majority of mechanics call this “ $\frac{1}{4}$ inch to the foot” the standard fall, simply because it is the minimum fall allowed by the Department, and I have in much of my work the greatest difficulty in securing the laying of the pipes at a larger fall where I think this would be desirable, the mechanics contending that the pipes have been laid at the standard $\frac{1}{4}$ -inch fall.

The rule which we find in nearly every plumbing reg-

ulation requiring the back venting of pipes—namely, that “branch vent pipes should be connected as near to the crown of the trap as possible,” is one which it would be well to omit entirely in the future, for it is not followed any longer in the case of earthen water closets and earthen slop sinks. Similarly in the case of basin and sink traps it is very seldom nowadays that one finds the branch vent applied to the crown of the trap, one reason being that this would require a coupling or washer joint at the back vent connection, which experience has shown to be unsafe. Therefore screw connections are prescribed by the rules, and while this manner of connection is all right, it does away with the branch venting of the crown of the trap; therefore, the above quoted rule should be abolished.

The intersection of the line of vent stacks into the adjoining soil or waste pipe, above the highest fixture, is now permitted by the majority of rules, and in New York City the only exception is “where there are fixtures on more than six floors.” The reason for this exception is somewhat obscure, and it would be decidedly more advantageous to carry all vent pipes separately through the roof, even if this does require an additional hole to be cut through the roof. Wherever the pipes are so arranged it is possible to make a successful peppermint test by pouring the peppermint into the soil or waste line, but where the vent intersects the same below the roof the peppermint test is in many cases a delusion and a snare, because some of the oil may flow through the vent into the bend of the trap, and thus come out into the room, apparently indicating a leak when really there may be none.

I have on some occasions found it necessary to disconnect certain fixtures, for instance, wash basins in the center of a house or in sleeping apartments, or else sinks in operating rooms of hospitals, from the soil or waste pipe system of the house, and where such disconnection is properly arranged it is, in my judgment, a perfectly safe and sanitary system, yet it seems almost impossible to get systems so arranged passed under the present rules of many departments.

One more instance of how even a good rule may fail to work properly.

All plumbing regulations now call for entire open plumbing work, and for tenement houses in particular the requirement is made in New York that sinks shall be left entirely open and the waste pipe and trap of said sinks are required to be of lead.” Now I am certainly as much as anybody in favor of open plumbing work, but in the case of tenement houses this rule is, from a practical point of view, a great mistake. The tenants of such quarters have at best a very limited space available, and it is natural for them to use every inch of space, even under the kitchen sink or washtub. They will store the coal scuttle or pails under the sink, and in a very short time the lead waste and lead trap are found dented or knocked flat, and the stoppage of the waste is the inevitable result; therefore, if the plumbing must be open the rule should call for either brass or iron traps and waste pipes and prohibit the use of lead pipes and traps.

“HOT AIR.” *

BY INSPIRED.

There's a tip at a season like this
That to furnacemen comes not amiss,
'Tis simply, take pains,
Use plenty of brains,
And business to you will be bliss.

To succeed in heating with air,
A rise must continue to where
The air is to go
With an easy flow:
So put up the pipes with great care.

If a lot of heat pipes you would feed,
To give plenty of fresh air take heed.
You'll find it's no feat
To drive up the heat
When the flues get the air that they need.

NATIONAL COMMITTEE OF THE CONFEDERATED SUPPLY ASSOCIATIONS.

With a full attendance the members of the National Committee of the Confederated Supply Associations held their annual meeting at the Arena, Thirty-first street and Broadway, New York, on Thursday of this week. The meeting lasted all day, routine business occupying a greater portion of the time. The Conference Resolutions were reaffirmed, and a special Committee of Five was appointed to consider the questions of difference arising between master plumbers and jobbers, in order that an adjustment may be more promptly reached. The following compose the

SPECIAL COMMITTEE.

B. Frank Hooper,* chairman.
N. O. Nelson.
A. M. Maddock.
Frank J. Knox.
John F. Wolff.

On taking up the election of officers all of the old officers were re-elected. The officers for the ensuing year are as follows:

Chairman, Francis J. Torrance.
Vice-Chairman, Frank J. Knox.
Treasurer, B. Frank Hooper.
Secretary, Charles W. Woodward.

The Walker Boiler.

In the accompanying illustration is presented a broken view of the Walker boiler for steam and hot water heating, which is being put on the market by the

The Walker Boiler.

Walker & Pratt Mfg. Company, 31-35 Union street, Boston, Mass. As will be seen, the boilers are of the vertical, sectional construction, embodying the return flue principle and the auxiliary crown sheet. By this means a larger surface is exposed to the direct action of the fire, and the long travel of the products of combustion utilizes their principal heat before they find exit to the smoke pipe. The sections are connected by means of a copper plated, malleable iron push nipple. The copper coating protects the nipples from corrosion, and also forms a slight yielding surface which helps to make up a tight joint.

The boilers are made in three series, numbered 15, 20 and 30, and in 19 sizes, ranging in capacity for carrying from 400 to 3650 square feet of direct hot water radiation, and from 240 to 2200 square feet of steam radiation. The boilers of the different series have grates 17, 22 and 31 and 32 inches wide, respectively, the length of the fire chamber varying with the number of sections

used. The fire box portion is so arranged that, if need be, a fire from 14 to 16 inches deep can be carried to insure a good fire throughout the night. In the 15 and 20 series triangular grates are used. In the 30 series, either triangular or rocking grates are furnished. The company state that they have been making boilers for over 30 years, and that this is the best boiler they have ever offered. A catalogue, which gives full dimensions and detailed explanation, with price-lists, has been prepared for distribution among the trade.

The Keene Combination Hose Pipe.

Those who sell hose pipe fittings will find in the Keene combination hose pipe, put on the market by H. N. Kirk of Keene, N. H., a device adapted for different

The Keene Combination Hose Pipe.—Fig. 1.—General View.

uses. It consists of a brass branch pipe threaded at one end for connection with ordinary garden hose having a stop cock and a hose nozzle and, as shown in Fig. 1, with a rubber sink flusher and collar adapted for removing the stoppage from waste pipes. The stop cock is so made that by turning it a solid stream or a spray may be thrown at will. Fig. 2 shows the application for removing the stoppage from a waste pipe, whether it be near a trap or some distance below it. It is only necessary to attach the flusher to the branch pipe and screw the branch pipe to the hose, connecting the other end of the hose with the cold water hose bib. The illustration shows a stoppage in the pipe at the point B, the sink partially filled with water, and a flusher inserted in the waste pipe at the point A. In use, the water supply

Fig. 2.—Method of Application.

should be turned on slowly so as not to make any severe shock on the thin waste pipe, otherwise it might be burst. It is pointed out that by careful use it will not only remove stoppage in the waste pipe near the fixtures, but also at some distance from them. Two sizes of collars are furnished, the smaller size being adapted for wash basins and bathtubs.

W. A. Dow, Sionx Falls, S. D., has just completed the installation of plumbing and heating systems in the Emerson Block in that city.

PROTECTION FOR JOBBERS OF PLUMBERS' SUPPLIES.

Much annoyance has been experienced by both the plumbers and dealers in plumbers' supplies through the erratic methods and quotations of some houses that have engaged in the wholesale plumbing trade without proper knowledge of the details of the business, the quality of goods and the customs of the trade. These concerns, where their methods have not caused demoralization in the prices and customs, have brought about an immense amount of trouble in the way of explanation and in refusal to follow the usual methods of old established houses. In order to eradicate this evil, the jobbers of New England have sent the following letter to the manufacturers and larger jobbers of plumbing supplies:

"The undersigned, jobbers of plumbing supplies, have agreed to purchase material only from manufacturers who confine their business to jobbing houses recognized by the National Committee of the Confederated Supply Association, and whose names appear on the list issued by said association."

It is signed by the following houses: Dalton-Ingersoll Company, Thomas Hoey Supply & Mfg. Company, F. W. Webb Mfg. Company, Joseph H. Young, Phillips Lead & Supply Company, the Dececo Company, Brown & Wales, E. F. Butler & Co., the William H. Gallison Company, James Barrett Mfg. Company, Louis Bourneuf & Co., Locke, Stevens & Co., the George Woodman Company, the Sumner & Goodwin Company, George E. Gilchrist Company, W. B. Hubbard & Sons and R. Estabrook's Sons.

Those who have applied and have had their names added to the list mentioned all agree that, while it has been necessary to satisfy the association of their knowledge and qualification to conduct a plumbing supply business, the capital employed and the stock to be carried, no unreasonable demand is involved and none of the information required is other than would be prompted by sound business principles, nor could it be objected to by the safe business man.

A BOWLING LEAGUE IN THE METROPOLITAN SUPPLY TRADE.

Through the efforts of Rollin C. Wilson, a meeting was held on September 19, at which the Plumbing and Steam Supply League was organized to participate in a bowling tournament, which will be held during the winter. The following officers were elected:

President, E. E. Haff.

Vice-President, G. G. Beach.

Secretary, Rollin C. Wilson.

Treasurer, W. C. Hallett.

Board of Managers: Harry M. Smith, J. S. Dibley, W. T. Gilmour, Albert Baerenklau and W. M. Murray.

The games will be bowled at the Monarch Palace Alleys at Twenty-sixth street and Sixth avenue, New York, on Monday and Thursday evenings of each week. Fifteen teams composed of representatives of the following supply houses have entered the league: Central Foundry Company, C. S. Locke & Smith, Behrer & Co., John A. Murray, Fred Adey & Co., Thomas G. Knight, H. P. Read Lead Works, John Simmons Company, Ronalds & Johnson Company, New York; Ronalds & Johnson Company, Brooklyn; Dimock & Fink Company, Crane Company, E. F. Keating, F. N. Du Bois Company, and a team composed of the following representatives: Rollin C. Wilson, James F. Conran of the Standard Sanitary Mfg. Company, W. H. Skirm and F. B. Miller of the Trenton Potteries Company, G. C. Ainsley of Chambers & Ainsley, Frank Wallace of the Henry McShane Mfg. Company, H. B. Olmstead of H. B. Olmstead & Co. and O. Chan Wells.

Cash prizes to the amount of \$117 have been arranged, seven for the teams, one for high team score and five individual prizes. The *Plumber and Fitter* has donated the greatest improvement prize, a pair of diamond cuff buttons. W. S. Emery has donated the least error prize, a pair of gold mounted opera glasses. The Trenton

Potteries Company have presented the league with a handsomely printed and bound pocketbook containing the schedule of the games and blanks for keeping a complete record of the team and individual scores and averages.

The tournament was opened on Thursday night in the presence of more than 100 enthusiastic representatives of the plumbing and steam supply trade. President Haff made an entertaining address explaining the working of the league and heartily commending this development of the social side of the trade. He then delegated to Secretary Wilson the honor of bowling the first ball for the league and, in modest appreciation of the favor, he satisfied himself with sending two pins to the pit. The schedule for the evening, on completion, found Behrer & Co. winning a game each from the Central Foundry Company and C. S. Locke & Smith, while C. S. Locke & Smith won one from the Central Foundry Company, the latter team losing two games. The highest score for the evening was 154, made by Arnold Behrer, the team score being 677. Nobody was so unfortunate as to make less than 100, and all were well pleased with the inauguration of the league.

The Wrought Iron Pipe Situation.

The ending of the recent labor troubles in the various plants of the United States Steel Corporation came as a welcome relief to the steam and hot water heating contractors. Had it not been for the ending of the strike last month considerable hardship would now be felt by those in the trade who have unfinished work on hand, and to whom the nondelivery of pipe meant loss of money through the enforcement of forfeits by owners and builders for whom the work is to be done. From all accounts, it will be long after the opening of the new year before the orders now in the hands of the pipe manufacturers will be completed, and this, too, despite the fact that the mills have been refusing orders since July. The demand for pipe has increased during the past week, and the prospects are that it will be greater as the cold weather sets in, and builders insist upon the completion of all heating work now under way.

New York City Notes.

The many friends of Thomas F. Gaynor of the National Executive Committee sympathize with him in the loss of his son, Thomas F. Gaynor, Jr., who was killed by a trolley car on September 28 while returning home from his father's shop. Young Gaynor was a fine, manly boy, about 14 years of age. His funeral services, which were held at St. Ignatius Loyola's Church on Tuesday, were attended by many representatives of the plumbing trade in the city.

* * *

E. J. McCabe, who was foreman for Byrne & Murphy on many of their large operations, has formed a partnership with J. F. Taylor, also from the shop of Byrne & Murphy. Under the name of E. J. McCabe & Co. they have opened a large and commodious shop at 862 Park avenue.

* * *

Among the large jobs now being done around town are the following: John Koch of 145 Sixth avenue, has the plumbing in the new church of St. Rose of Lima, on Cannon near Grand streets. T. J. Byrne of Fourth avenue, is well along in the extension to the German Hospital, at Seventy-sixth street and Lexington avenue. Geo. A. Pace has the plumbing of additional two stories that are being added to an apartment house at Madison avenue and Seventy-seventh street. Lasette & Murphy of Broadway are very busy with a large apartment house at Ninety-third street and Riverside Drive. De Graw & Cully have a large 12-story apartment hotel on Thirty-fifth street, between Broadway and Sixth avenue. Wm. Boss has just finished an apartment house at Broadway and Ninety-third street. Harry Spencer is well on with a seven-story apartment house at Ninety-seventh street, east of Riverside Drive; and

Black Bros. of St. Nicholas avenue have just finished a complete overhauling of the Hotel Cecil, St. Nicholas avenue and 118th street.

* * *

Withers & Stuckey of 786 Third avenue have been in hard luck lately. Last week their shop was broken into and about \$150 worth of brass and lead were stolen, and last Tuesday the building was set on fire. The blaze was fortunately put out with but little damage.

* * *

President Wallace of the Department of Buildings appeared before the Municipal Assembly last week in support of an addition to Article 150 of the Building Code providing for additional penalties for violations of the code, making the same a misdemeanor, punishable by fine or imprisonment, and including in the same "any architect, builder, plumber, carpenter or mason." Mr. Wallace said he wanted to protect those builders and mechanics who do good work from those who do not. The amendment was finally passed, making the builder responsible.

Heating and Plumbing Notes.

J. M. MARSHALL, assistant quartermaster-general at Jeffersonville, Ind., will receive bids until October 16 for plumbing the Central Office Building at the Jeffersonville Depot.

PLUMBING INSPECTOR HARRY THOMPSON, William Robinson and William Vanderveer of the Board of Plumbing Examiners of Grand Rapids, Mich., are preparing a series of examination questions for use in examining plumbers for licenses under the State law. The time allotted for the examination expires December 1.

THE BACKUS WATER MOTOR COMPANY, 178 Pennsylvania avenue, Newark, N. J., are sending to the trade a 36-page catalogue devoted to the Backus Water Motor, which is made in varying capacities, from $\frac{1}{8}$ to 10 horsepower, suitable for driving all kinds of light machinery, such as sewing machines, coffee and drug mills, church organs, ventilating fans and simple manufacturing machinery. The text gives a complete explanation of the construction and operation, and a variety of testimonial letters show the various uses to which the Motors have been successfully put. The cuts illustrate the application of the Motors to the machinery of printing offices, church organs, sewing machines in the ordinary residence and ice cream freezers. It is pointed out that they are well adapted for driving the pipe cutting and threading machinery of steam and gas fitters. The text also explains the capacity of the different sized Motors under varying water pressures. It is accompanied by a complete price-list. The last pages are devoted to a variety of Exhaust and Blowing Fans and Ventilating Fans made by the company.

THE MACKIN-KELSEY HEATING COMPANY, Philadelphia, Pa., have taken out city permits to install heating plants at 1805 Spring Garden street, 162 West Penn street, Germantown; 1724 Pine street, 1827 Walnut street, 115 South Twenty-first street and in a church and nursery school at Wayne and Harvey streets, Germantown, all in the city of Philadelphia, to cost in the aggregate \$4600.

WILLIAM KAISER & SON, Wilkes-Barre, Pa., report that they are very busy with large heating work, and are installing in one large brownstone residence, exposed on all sides, two Kelsey Warm Air Generators in a battery, with what is known as the twin connection.

SANDERS BROTHERS & JACOBSON, Sioux Falls, S. D., inform us that they have the contract for the plumbing and heating of the W. A. Lord properties, consisting of the Cascade Block and Temple Court on Main avenue and the Bell Block on Ninth street, Sioux Falls.

WILLIAM N. TOBIN, Syracuse, N. Y., has secured a \$15,000 contract for heating and plumbing the new hotel in course of erection at Gloversville, N. Y. Mr. Tobin also has a contract for heating and plumbing a large modern summer hotel at Long Lake in the Adirondacks.

CHARLES MCGOVERN, Sioux Falls, S. D., has the contract for installing the plumbing in two new tenements that are being erected in that city by Senator Klitteridge.

CAPTAIN D. E. MCCARTHY, quartermaster at Fort Leavenworth, Kan., will receive bids until October 26 for plumbing, heating and electric wiring 13 buildings, including barracks for the men and officers' quarters.

THE Master Plumbers' Association of Syracuse, N. Y., has sued one of its members for failure to pay his dues and fines.

THE UNIONTOWN ACME RADIATOR COMPANY, Uniontown, Pa., have received bids and are arranging for the erection of a foundry building, 120 x 200 feet; machine shop, 50 x 200 feet; cupola house, 25 x 38 feet, and sand shed, 25 x 152 feet. All of the buildings will be of brick and steel construction.

E. W. BLATCHFORD & Co., Chicago, Ill., are erecting a \$100,000 warehouse on the site of the old shot tower on Fulton street.

INGLIS & WORKMAN, Grand Rapids, Mich., have been awarded the contract for plumbing a new hotel in that city, which calls for the equipment of 50 bathrooms. Every room in the house, numbering over 100, will also have a lavatory. The contract will amount to more than \$6000.

THE SOUTH CHESTER PIPE & TUBE COMPANY of Chester, Pa., are contemplating the erection of a large rolling mill in connection with their Pipe and Tube plant. The structure, which will be of large dimensions, will be of brick and iron and will be located at the eastern end of the present Tube works and adjoining the plant of the Tidewater Steel Company. It will be used to furnish the material for the Tube mill. Building operations will be commenced as soon as plans are completed.

THE constructing quartermaster at Delaware City, Del., will receive bids until October 15 for the plumbing and electric wiring and pumping machinery at Fort Du Pont, Del.

E. WALTHER of the Walther Plumbing & Heating Company, Washington, Iowa, advises us that his city has voted in favor of an issue of bonds, for the purpose of erecting an electric light plant with all the necessary apparatus, to cost not more than \$17,500.

BLAKE & ANDROS, 28 Portland street, Boston, Mass., manufacturers of the Crescent Hot Water and Steam Heaters and the B. & A. Combination Union Elbow Valves for hot water, advise us that they are enjoying an excellent trade in their specialties. The firm point out that their Valves have been thoroughly tested, and thousands of these fittings are now in use throughout the country. They invite the trade to write to them for a copy of their booklet "A," which tells all about the B. & A. Valves.

THE theater on the Ocean Pier at Atlantic City, N. J., is to be inclosed and equipped with a steam heating plant, so that it can be run as a place of amusement throughout the winter.

THE work of pushing the erection of the House of Detention for Unfortunate and Criminal Children, at Albany, N. Y., is being advanced. The contract for a hot water heating plant has been awarded to Ridgway & Tyler at their bid of \$2765, while the plumbing contract has been secured by H. H. Rusk & Co. The roofing contract has been awarded to James Ackroyd for \$1024.

J. W. CUFF & Co., heating and ventilating contractors, Philadelphia, Pa., have recently obtained a contract to install hot water heating plants in each of 36 houses building at Forty-second street and Parkside avenue, Philadelphia, for F. A. Poth. Each house will be equipped with 28 radiators, with 1370 square feet of radiating surface. Eight-section No. 1 Mercer boilers will be installed and supply and return mains are to be covered. They are also installing for Edward Bromley, 1931 North Broad street, a hot water heating system of 20 direct radiators, and have just closed a contract with the Reformed Episcopal Church, Allegheny avenue and F street, for the installation of a hot water heating plant consisting of 16 Coronet radiators, 693 square feet of heating surface and a seven-section No. 2 Mercer boiler. These three contracts amount in the aggregate

to \$38,800. Besides these J. W. Cuff & Co. have a large number of other contracts in course of completion and report heating and ventilating trade conditions most favorable.

At a meeting of the Master Plumbers' Association of Cleveland, Ohio, on October 1, says the *Leader* of that city, there was a large attendance and the subject of starting a co-operative supply house was hotly discussed without definite action being taken as far as could be learned. The movement has been the subject of discussion for some time, and is said to be due to dissatisfaction with the prices ruling in the market for plumbing goods.

THE CRANE COMPANY, Omaha, Neb., have purchased a plot of ground extending 132 feet on Tenth street and 66 feet on Harney street, where they will erect a \$60,000 business building, for the accommodation of their Plumbers' and Steam Fitters' Supply business. The new establishment will have excellent railroad facilities, as a track extends by their property on the Harney street front.

DANIEL S. INGERSOLL, a plumber of Beverly, R. I., died at his residence on September 30, aged 64 years.

F. F. HITCHCOCK of Woodbury, Conn., has been appointed National State Vice-President for Connecticut by President E. D. Hornbrook of the National Association of Master Plumbers.

DEPUTY COMMISSIONER NEVILLE of the Department of Public Works of Rochester, N. Y., recently held a school for the instruction of plumbing inspectors, when the plumbing regulations were read section by section and the spirit and letter were thoroughly explained. This course of proceeding is one that could be followed by officials in many cities with advantage to all who have plumbing work done.

New Firms and Changes.

THE KELLOGG & WAKEFIELD MFG. COMPANY, Hartford, Conn., manufacturers of Metal Sanitary Goods, have acquired the stock and property of the Phillips-Kellogg Company of Winsted, Conn., and will transfer their business to a plant in that city.

FREEMAN BROTHERS, Ithaca, N. Y., who have conducted a tinnery's shop in the Titus Block, have purchased the entire stock of the Ithaca Plumbing Company. Their business will be considerably enlarged by this addition. The main office of the firm will be at 125 West State street.

THE EASTERN ACETYLENE GAS COMPANY, 30 Close street, Paterson, N. J., have been incorporated with a capital stock of \$125,000, of which \$75,000 is common stock and \$50,000 preferred, \$1000 being paid in as working capital and held by the incorporators, who are J. H. Kugler, Paul W. Ryder and Edward S. Chambliss. They will manufacture Acetylene Gas Apparatus, Gas Burners, Lamps and Stoves. Their office is in charge of S. J. Holden.

HENRY CLARK has opened a Plumbing and Hardware store at Richford, Vt.

A. B. BARR & Co., Yonkers, N. H., have been incorporated for the purpose of manufacturing Steam and Hot Air Heating Apparatus.

JESSE WHITMAN has purchased the Plumbing and Hardware business of P. K. Scofield, at Bainbridge, N. Y.

SWEET BROTHERS have established a shop at Dowagiac, Mich., to conduct a business in Plumbing, Heating, Lighting and Sheet Metal work of all kinds. The members of the firm are William E. and Charles E. Sweet. They are general agents for the Doran light.

A. P. BRADBURY & SON succeed the firm of Bradbury & Stewart in the Plumbing and Stove business at Oldtown, Maine.

COPLEY & COPLEY are a new firm in the plumbing business at Riverside, Cal., composed of Fred. Copley, who was formerly a member of the firm of Copley & Taylor, and Will Copley, who has been in the employ of

McCormick & Ormond. The new firm have taken a store in the Evans Block, at Tenth and Main streets.

An Automatic Caterer.

Recent visitors to the Earl's Court Exhibition, near London, have found a brand new feature in the penny in the slot line which is exciting considerable interest and comment. The *London News* describes it as follows: It will probably be approached with distrust, for it looks like a cross between a chemist's shop and a place for the distribution of instant death. Nevertheless, it is not only innocent, but beneficent, being an apparatus for providing food on the penny in the slot principle. At the same time it does not in every case give up its good things for so small a coin. It demands varying numbers of pennies up to six, the sum being in accordance with the blessing bestowed. There are many slots, and if you put four-pence into one of them you get a nice tray, bearing a small pot of sugar, a little jug of milk, a cup and saucer and a tasty teapot containing tea. You fill the pot with hot water at another part of the shrine, and you do so for nothing as often as you like, hot water and soda water being free in this latest product of civilization. Another gratuity is an arrangement for washing glasses. Tumblers are ready to hand, and if the one you get hold of has been used before you have only to press it upside down on a thing that looks like a big bunion. Thereupon a powerful jet of water rises from the bunion and rinses all the microbes out of the glass. Roll and butter, cake, ices and teetotal drinks of all kinds can be got by putting one or more coins in the proper slots; but the automatic buffet at Earl's Court refuses to give way to the craze for drink, though half a dozen of its brothers are about to do so in the city. The Earl's Court buffet will remain for three years, during which its patrons will be able to see how fast they can bolt food without wrecking the digestion. It is said that miraculous speeds have been attained in Germany (the home of the invention), Austria and Belgium. In Cologne, for example, one of these machines has supplied 12,000 glasses of beer and 5000 sandwiches to the public in one day without any appreciable rise in the death rate. One of the beauties of the apparatus is that you can neither cheat it nor be cheated. If there is anything wrong it automatically returns your money, and if you insert a French penny or a fraudulent disk of any kind it scornfully rejects the offering.

TRADE NOTES.

THE BACKUS HEATING COMPANY of Brandon, Vt., have awarded the contract for the construction of their foundry and machine shop to C. W. Carr & Son. The buildings will be of wood, one 40 x 145, of one story, and the other 32½ x 82½ feet, of two stories.

WITH reference to the report of an agreement on prices between the European Aluminum manufacturers and the Pittsburgh Reduction Company, a dispatch from Berlin, Germany, quotes from the *Frankfurter Zeitung* an authoritative statement to the effect that no such agreement has yet been reached. Negotiations looking to the end in question are, however, understood to be on foot.

THE BRASS and Aluminum foundry of Charles Mousley & Co., Howard street, above Girard avenue, Philadelphia, Pa., was almost entirely destroyed by fire on the morning of September 26. Valuable machinery patterns and castings were destroyed. The loss is estimated at \$15,000, said to be covered by insurance.

THE D. M. STEWARD MFG. COMPANY, Chattanooga, Tenn., since becoming the sole property of Mr. Steward some weeks ago, have made extensive improvements in their plant. They are preparing to market a new line of Cap Mantels for incandescent gas lighting.

THE REYNOLDS WIRE COMPANY, Dixon, Ill., are erecting a building as an addition to their Wire Cloth plant. The additional building will be 50 x 80 feet in size, three stories high, and will be used for the purpose of manufacturing Wire Goods, such as Corn Poppers, Dish Covers, Flour Sifters, Strainers and other articles related to the Wire Cloth trade.

Pattern for a Fork.

A correspondent in Pennsylvania wishes us to tell him how to lay out a pattern for a crutch or fork, shown in the drawing which he sends. He says he can lay out the pattern for one that is round, but cannot do it where it is in this form.

On our correspondent's drawings the measurements for the crutch were given, but have been omitted in Fig. 1, as it makes no difference what the size or shape may be, the principles here explained being applicable in any case. Let A B C D E F G H be the elevation of the fork and I J K L the profile on C D, the semicircular ends being struck from the centers M and N, the profile on H A being similar. O P R S shows the section on G E, the semicircular ends being struck from the centers T and U, while P S in soffit plan shows the miter line between the fork on B F in elevation.

It will be noticed that the width of the soffit plan at P S is equal to J L in the section on C D in elevation.

Fig. 1.—Plan, Elevation and Sections.

PATTERN FOR A "Y" OR FORK.

To complete the plan proceed as follows: Through the centers T and U in plan extend the line indefinitely either way, as shown by V W. At right angles to V W, and from the centers T and U, draw lines intersecting the base line G E at Z and Z'. In similar manner, at right angles to I K in the elevation and from centers M and N, draw lines intersecting the line C D at X and Y respectively. From X draw a line to F and from Y draw a line to Z; then that portion shown by X Y Z F will remain perfectly flat, the top and bottom having curved sections. From the points C and D in elevation, and at right angles to V W in plan, draw lines intersecting the center line W V at C' and V respectively. In similar manner, at right angles to W V and from points X and Y, drop lines indefinitely, intersecting the line W V in plan at X' and Y' respectively. Now take the distance from M to L in profile in elevation and place it as shown from X' to L', Y' to L', Y' to L' and X' to L'. Draw a line from L' to L' and from L' to L', and draw an elliptical figure through L' V L' and L' C' L', which will be the soffit plan on C D in elevation. Draw this plan in its proper position on the opposite side and W P V C' S O will be the correct soffit plan of the fork, all as shown by the dotted lines.

It now becomes necessary to obtain a section through

P S in plan, for which proceed as follows: As P S represents the base width in plan and F B in elevation the vertical height on the center & in plan, take the width of & P and & S in plan and place it as shown by F P' and F S', respectively, in elevation. Through the points P' B S' draw any section at pleasure, as shown by the shaded lines, which represent the true section on B F in elevation.

As the arm will be developed by triangulation, it will be necessary to obtain sections with which to develop the pattern, for which proceed as follows: Let 1, 8, 9, 19, 16 in Fig 2 be a reproduction of C D E F B in Fig. 1. Take a tracing of the half profile I J K and place it as shown by 1, 5, 8 in Fig. 2. In similar manner take a tracing of the quarter plan & R S in Fig. 1 and place it in Fig. 2, as shown by 19, 9, 13, and finally take a tracing of the half section in elevation, B F P' in Fig. 1, and place it as shown by 16, 19, 13' in Fig. 2. As the two arms shown in Fig. 1 are symmetrical, then the pattern for the one will answer for the other, and the part elevation and the sections thereon in Fig. 2 be all

Fig. 2.—Diagram for Obtaining Measurements for Sections.

that is required for obtaining the patterns for the fork. Divide the sections 1 5 8, 9 12 13 19 and 19 13' 16 into equal spaces, as shown by the small figures 1 to 8, 9 to 13 and 13' to 16 respectively. At right angles to 1 8, and from the small figures 2 to 7, draw lines intersecting the line 1 8 from 28 to 23 respectively. In similar manner, at right angles to 9 19 and 19 16, and from points 10, 11 and 12, and 14 and 15, draw lines intersecting the lines 9 19 and 19 16 at 22, 21, 20 and 18 17 respectively. Now draw solid lines from 28 to 17, 27 to 18, 26 to 19, 25 to 20, 24 to 21 and 23 to 22, and dotted lines from 1 to 17, 28 to 18, 27 to 19, 26 to 20, 25 to 21, 24 to 22 and 23 to 9. Then will these solid and dotted lines represent the bases whose vertical heights are equal to the various sections or profiles.

For the sections on solid lines proceed as is shown in Fig. 3, where the various base lines of the sections have similar figures as the base lines in Fig. 2, and the various figures of the heights in Fig. 3 correspond to the various heights in the profiles in Fig. 2. For example, take the distance of 19 26 in Fig. 2 and place it on any horizontal line, as 19 26 in Fig. 3. At right angles to 19 26, and from points 19 and 26, draw the lines 19 13' and 26 4 equal to 19 13' and 26 4, respectively, in Fig. 2. Then draw a line from 4 to 13' in Fig. 3, which will equal the actual

distance on the finished article on the line 26 19 in Fig. 2. In precisely the same manner obtain the diagrams of sections on dotted lines as are shown in Fig. 4, where similar numbers represent similar bases and heights in Fig. 2.

For the pattern proceed as follows: Draw any vertical line, as 1 16 in Fig. 5, equal to 1 16 in Fig. 2. Now, with 16 15 as radius and 16 in Fig. 5 as center, describe the arc 15; then, using 1 as center and 1 15 in Fig. 4 as radius, describe an arc intersecting the arc 15 in Fig. 5. Now, with 1 as center and 1 2 in Fig. 2 as radius, describe the arc 2 in Fig. 5, which intersect with an arc struck from 15 as center, with a radius equal to 2 15 in Fig. 3.

Proceed in this manner, using alternately as radius first the divisions in the profile 16 19 13' in Fig. 2, then the lengths of the slant lines in Fig. 4; the divisions in

Fig. 3.—Sections on Solid Lines in Fig. 2.

Fig. 4.—Sections on Dotted Lines in Fig. 2.

the profile 1 5 8 in Fig. 2, then the lengths of the slant lines in Fig. 3, until the line 4 13 in the pattern in Fig. 5 has been obtained. Then proceed in the same manner, using alternately as radius first the divisions in the profile 9 13 19 in Fig. 2, the lengths of the slant lines in Fig. 4, the divisions of proper number in the profile 1 5 8 in Fig. 2, then the lengths of the slant lines in Fig. 3, the length of 8 9 in pattern in Fig. 5 being obtained from 8 9 in Fig. 2. Trace a line through points thus obtained in Fig. 5, as shown by 1 4 5 8 9 12 13 16, which will be one-half of the pattern. Trace the other half opposite the line 1 16, as shown. Then will 1 8 9 13 16 13' 9' 8' 1 be the completed pattern for one arm, of which two are required, one right and one left, to complete the fork.

John L. Blankemeyer.

John Leon Blankemeyer, president of the Toledo Foundry & Machine Company, died September 20 at the City Hospital, Toledo, Ohio, at the age of 58 years. Six years ago, while examining a heavy piece of work, Mr. Blankemeyer met with an accident which permanently destroyed his nervous system and since that time he was more or less of an invalid. Two months ago his condition became so alarming that he was removed to the hospital. His death occurred very suddenly in that institution. Mr. Blankemeyer was born in Amsterdam, Holland, and at the age of 18 went to London, England, where he served an apprenticeship in the iron manufacturing business. At the age of 22 he came to this country, arriving at the close of the Civil War. He went directly to Toledo and obtained employment with Henry Moore & Sons of that city. After five years he

bought out the business and founded a stock company, which is now known as the Toledo Foundry & Machine Company, with which concern he was actively engaged up to the time of his death. The company are large manufacturers of tin can and steel range machinery and other sheet metal working tools. Mr. Blankemeyer was a prominent figure in the industrial life of his city, and was also actively connected with the marine interests of the port. He was married twice and is survived by a widow, three sons and three daughters. The funeral took place from the Emmanuel Methodist Episcopal Church, Toledo, on September 27, and the interment was made in the Forest Cemetery.

THE AMALGAMATED RULES AND TIN PLATE PRODUCTION.

The restriction of production in the tin plate plants operated under the rules of the Amalgamated Association is a serious matter. Under these rules, for instance, the output of a hot mill running on No. 30 gudge black

Fig. 5.—The Pattern Shape for One Arm.

PATTERN FOR A "Y" OR FORK.

plate is 5750 pounds in an eight-hour turn. It has been demonstrated by experience in nonunion mills that a crew can easily roll 7000 pounds, and with a fair degree of energy the product is run up to 8000 pounds. Taking the minimum of these quantities, it will be seen that the output of the mill could be increased fully 20 per cent. The Amalgamated Association controls only the hot mills, but the other departments of a tin plate plant are, of course, dependent on the hot mills for their supply of material. The production of these departments is consequently restricted to the same extent. It is unquestionably an unreasonable handicap which is thus placed on the owners of a tin plate plant, preventing them from realizing the full output of which their machinery is capable. The workmen on hot mills being paid by the ton, their daily earnings would, of course, be increased with the increased production.

Drawing Presses and Spinning Lathes.

The E. W. Bliss Company of Brooklyn, N. Y., are distributing a 48-page catalogue covering the drawing presses and spinning lathes manufactured by them, and also those formerly made by the Stiles & Parker Press Company. These presses were awarded a grand prize at the Paris Exposition in 1900. A view of the E. W. Bliss Company's machine shops is presented on the first page, followed by one of the concern's large erecting shops in Brooklyn. The first part of the catalogue is devoted to illustrations and descriptions of the Bliss patent toggle drawing presses, which are equipped with all the latest patented devices, and are claimed by the manufacturers to be the acme of toggle drawing presses. They are offered in 11 sizes, and are equipped with the

company's automatic friction clutch. These presses are suitable for working all kinds of sheet metal articles, from the smallest to the heaviest stamped utensils made. The press No. 13 is calculated to manipulate blanks up to 38 inches in diameter and to draw articles up to 27 inches in diameter and 11 inches in depth. The Bliss bottom slide drawing press with movable bed is also given attention, together with a line of patented double action crank presses for the forming of small sheet metal articles. Among other machines illustrated and described are cutting, drawing and stamping presses, cam drawing presses and paper drawing presses, also a line of Bliss reducing presses. Bliss spinning lathes occupy the last few pages of the catalogue. Tables of weights and sizes of the various parts of all these machines are also provided, together with a telegraphic code for use by purchasers in ordering machines or their parts by wire.

Enlarging the Monessen Tin Plate Works

The Monessen Works of the American Tin Plate Company, at Monessen, Pa., will be doubled in capacity at a cost of more than \$500,000. The decision to increase this plant was a direct result of continuous operation through the strike, this being the only works of the American Tin Plate Company that was not shut down. Contracts have been awarded to the American Bridge Company for structural material and extensions, and to the Bass Foundry & Machine Company of Fort Wayne, Ind., for engines of 1500 horse-power. Six mills have already been started from the plant at Canal Dover, which is to be dismantled as a result of the strike there. There is also a possibility that six more mills will be brought from Cambridge, Ohio, as the machinery for the three plants is identical. Part of the machinery has been taken to Monessen and it is expected that ground will be broken in a few days. C. W. Bray, chief engineer of the American Tin Plate Company, and P. E. Donner, manager of the Monessen plant, will be in charge of the improvements. Some of the structural iron buildings for the increased capacity are now in course of erection and excavations for the same are being made.

Architectural Ornaments in Sheet Metal.

A catalogue issued by Martin J. Frand & Co., 110-112 Arch street, Camden, N. J., contains illustrations of an extensive assortment of architectural ornaments, which they manufacture of sheet zinc, brass, copper and cast zinc. The catalogue is the "sixth series," and is intended for the season of 1901. The size and shape of the publication is such as to permit of the use of a large number of illustrations on each page, together with an indication of the size of the ornament and its price. The illustrations cover moldings, rosettes, center pieces, finials, crestings, brackets, urns, capitals, spindles, heads of various kinds, figures, statuary, monuments, designs for ceilings and siding, building fronts in imitation of rock face stone and brick, cluster steel shingles for roofing, mansards and siding, embossed metal tiling, &c.

Interiors of Sheet Metal.

We have received from the S. Keighley Metal Ceiling & Mfg. Company, 819-823 Locust street, Pittsburgh, Pa., a copy of a 30-page catalogue, which they have just issued, showing illustrations of designs for ceilings, siding, &c., in sheet metal. The illustrations are for the most part half-tones, and in many cases are of a size to fill an entire page measuring 7 x 10 inches. The catalogue is bound in deep green covers, stitched at the back with red silk and cord. In the early pages are to be found instructions for putting up lap joint ceiling as well as the company's lock joint dust proof ceiling. Some of the illustrations show interiors ceiled with sheet metal, producing very artistic effects. In addition to the designs of ceiling and siding are moldings, cornices, beam coverings, center pieces, &c.

The Tin Plate Workers.

A Pittsburgh dispatch of October 3 says that the American Tin Plate Company have adopted a policy of conciliation toward their employees who were recently engaged in the steel strike. While the terms of settlement of the strike do not permit the recognition of the Amalgamated Association in some of the company's works not the slightest discrimination, it is officially stated, will be allowed against the old men when they return to work.

The tin workers of the Star and Monongahela plants have not yet resumed work as a body. Some of the old men have gone back to the mills, but the majority of them are still waiting for recognition of their union. Aided by the nonunion men brought to the plants during the strike the management has been able to operate both mills successfully since the strike was declared off. All the tin mills of the country are overcrowded with orders at the present time and a prosperous winter is assured.

FLASHINGS.

THE JACKSON IRON & STEEL COMPANY, recently incorporated with a capital stock of \$300,000, at Clarksburg, W. Va., will erect a 14-mill Tin Plate plant. Contracts for machinery have been placed, and the erection of buildings will begin at once. The officers of the company are: T. Moore Jackson, president; W. I. Grove, secretary, and C. C. Moore, general manager.

THE YOUNGSTOWN IRON, SHEET & TUBE COMPANY of Youngstown, Ohio, have placed an order with the Lloyd Booth Company department of the United Engineering & Foundry Company, Pittsburgh, Pa., for one 26-inch Sheet train, one 20-inch three-high Bar mill, two squaring shears, two lever shears, two roll lathes, and other tools.

THE DOWMAN MFG. COMPANY, Atlanta, Ga., are engaged upon a number of important contracts for Tin and Metal work on large buildings, including the Grant Building and the Central Bank Block at Atlanta; the Alumni Hall at Durham, N. C.; the Telephone Exchange, the Smith & Zinkle Building and the Houghton Building at Montgomery, Ala.; the Thiesen Building at Pensacola, Fla., and the new tennis court at Aiken, S. C. The company report that they are also in receipt of a large number of orders for their Dixie Ventilators.

THE British Board of Trade returns for the month of August show a considerable increase in the shipments of Tin Plates to the United States. The total exports during the month amounted to 8508 tons, as compared with 4166 tons in August, 1900. The total shipments of Welsh Tin Plates to this country for the first eight months of the present year aggregated, according to the same authority, 41,369 tons, as against 39,251 tons in the corresponding period of 1900. The increase, of course, was due to the shutting down of most of the Tin Plate mills in this country, bringing about a scarcity of American Plates in the home market.

THE Sheet mill of the American Sheet Steel Company, at Carnegie, Pa., is being dismantled, and the equipment is being sent to Leechburg, Pa., where it will be stored for the present. The office force from Carnegie have been transferred to Vandergrift, Pa.

A BLOTTER, issued by the J. M. & L. A. Osborn Company of Cleveland and Columbus, Ohio, bears a half-tone illustration of the First Methodist Episcopal Church, Troy, Ohio, a handsome building, which is roofed with Osborn's Genuine Charcoal Iron Old Style Roofing Tin.

THE strike is a matter of history at McKeesport, Pa., nearly all the industrial works there being in full operation. The Boston rolling mills of the National Tube Company started on Monday, and by the end of this week the National rolling mill of the same concern will be in operation. The Tube mills of the National Tube Company are running full, as are also the Wood plant of the American Sheet Steel Company and the United States works of the American Tin Plate Company at Demmler. Many of the men who were leaders in the strike and who gave a good deal of trouble have been

notified that their services will not be needed. Agents of foreign Tube mills have employed a good many men, and some of the most skilled Tube workers have made five-year contracts to work in English mills.

THE Sheet Bar mill at the new plant of the Youngstown Iron & Steel Roofing Company, at Youngstown, Ohio, is about finished and will be started up in a few days. This bar mill was not finished at the time the Sheet mills of this concern were started up a month ago.

It is claimed that the McKeesport Mfg. Company, recently organized at McKeesport, Pa., will build a Sheet mill, to be located somewhere along the Monongahela River, in the Pittsburgh district.

THE CUMBERLAND WORKS of the American Tin Plate Company, at Cumberland, Md., have been abandoned. The mills have been shipped to the Humbert Works, at Connellsville, Pa.

THE STANDARD PAINT COMPANY, 100 William street, New York, are sending out a 14-page illustrated booklet in which facts about their Ruberoid Roofing are demonstrated. This Roofing is designed for all kinds of buildings, from the light temporary frame structure to large brick, stone or iron buildings.

JOSEPH BIECHELE, president of the Berger Mfg. Company, Canton, Ohio, was one of the honorary pall bearers at the funeral of the late President McKinley. Mr. Biechele was a long time friend of President McKinley.

Telephone Systems in Private Houses.

It is not uncommon at the present day to find in many of the more pretentious private houses a modern telephone system connecting the various departments of

Fig. 1.—General View of Telephone for Private House. Fig. 2.—The Microtelephone with Intercommunicating Switch.

TELEPHONE SYSTEMS IN PRIVATE HOUSES.

the household with each other. The main advantage of the telephone over the speaking tube is that one outlet or one 'phone can be used to communicate with all the different stations, whereas with the speaking tube a separate mouthpiece was needed for each and every station. In locating these outlets for the telephone great care should be taken in placing them where they will be most convenient for the use of the household, and also where they will not interfere with any of the fittings of the house which are to be installed at a later date, such as radiators, sideboards, &c. A very convenient place is near the casing of the door, where it is almost impossible to place any heavy article of furniture, but caution should be used in first ascertaining which way the door is to swing.

The wire cable which is used in connecting the various stations should run as far from the water pipes as possible, on account of breaks in the pipes which are liable to occur and the moisture from which would injure the wires, make cross connections, cause leaks of current and soon destroy the vitality of the battery. A cable having a weather proof insulation is preferable, not only on account of the properties which prevent moisture from entering it, but also because a cable of this kind is not attacked by rats or mice. These animals gnaw the insulation, and, while they do not injure the wires, in the ordinary cable they frequently cause crossing or grounding of wires which are difficult to locate and is very annoying both to the owner and the electrician.

Wall pockets or receptacles for holding the telephone are very useful at the outlets, for while keeping the telephone fully covered they do not deface the walls, and by their use many of the connections can be made inside and a buzzer or bell can be placed within for the purpose of calling that station. The telephone itself can be very small and compact, as shown in Fig. 1, and by using the hand microtelephone in connection with a selective switch, Fig. 2, an instrument having a capacity of 15 stations will occupy a space of only 4 or 5 inches square. These two simple instruments, which are obtained from the Ericsson Telephone Company of 296 Broadway, New York City, are well adapted for household purposes, and can be finished as regards the wood work to match the finish of the room, and thus the telephone can be made an ornament as well as a great convenience. In some mansions the wooden cases have been made of solid ebony, rosewood or other costly woods, while the metal parts have been gold plated.

There is no limit to the flexibility of a system of this description, as any station can call all the departments or it can be so wired as to call only a certain number. Arrangements should be made for bringing the cable to a point where it can be attached to wires going to the stable, greenhouse, &c., these connections being especially convenient for the lady of the house, as in ordering the carriage for a drive, &c.

By a simple attachment in the owner's chamber the telephone system can be instantly converted into an alarm system, and all the bells be made to ring at one time by the simple pressure of a special lever. This can be used in case of fire, burglars or sickness, and is valuable in suburban residences.

The cable itself should be installed while the house is in process of construction, and should be put in place before the studding is covered with lath and plaster. The instruments themselves should not be placed on the wall until all workmen have left the building for good, as a telephone is apt to be regarded as an object of curiosity by the men doing other work and oftentimes considerable damage is done by their carelessness.

Briquettes from Garbage.

United States Consul Warner, at Leipzig, Germany, reports that a process has been discovered in France by which garbage is converted into briquettes for fuel purposes. The process consists of mixing refuse from abattoirs, fish markets, &c., waste paper and the like and adding thereto tar and naphthalene. The whole mass is then mixed in a kneading apparatus, dried and pressed into briquettes. These briquettes are described as having a slight odor of gas and they are said to burn brightly and slowly. A report from the Paris Municipal Laboratory states that with a more highly perfected method of manufacture they will produce less ash and the heat producing qualities will be about equal to those of common coal. They are also said to possess the advantage of burning slowly and developing no smoke. This method of treating garbage seems to promise a good solution to the problem of the disposal of city garbage. It would certainly secure a more profitable disposal of refuse than the cremation process, in vogue in so many cities, which is practically a waste of material.

THE LETTER BOX.

Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.

Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.

FURNACE QUESTIONS ON SCHOOL HEATING.

From T. J. Grier, Martin's Ferry, Ohio.—In answer to the inquiry of "J. M." in *The Metal Worker* of September 21, I will say that on the plan given in Fig. 1 there is all the necessary data that will be required in

Furnace Questions on School Heating.—Fig. 1.—Plan Showing Suggested Arrangement of Plant.

installing a hot air system for the school building he refers to. In the first place it will be necessary to locate the furnace properly in the cellar; next, be sure to get the hot air pipes amply large. Then be sure to get register faces of proper size for the hot air pipes. Then he can provide a proper sized window on the west side of the building for the cold air supply. The cold air

Fig. 2.—Elevation, with Dimensions.

supply should be equal in square inches to the combined area of all the hot air pipes, which is 1857.26 square inches. The cold air supply should have some means by which the supply could be regulated, as some days the outside temperature would be very low and it would not require as much air as when the temperature is higher. I would suggest a 20-inch hot air pipe with 20

x 24 register face for the hall. For the first floor rooms 24-inch pipes with 24 x 26 register faces with 18 x 24 inch wall stacks. For the second-floor rooms 20-inch pipes, 20 x 24 inch register faces and 12 x 20 inch wall stacks.

As for ventilation, I do not have much faith in the two vents already provided in the building, but, of course, they may be used by placing a register face as near the floor as possible, and have these faces as large as flues will permit. I would also provide vent flues, as are shown on the drawing in end of cloak room around smoke flue. As the smoke flue will be heated this will help to keep the vent stacks warm. These stacks should be equal in square inches to the hot air supply, if possible, and the register faces in them should be placed as near the floor line as possible, and be equal in size to the hot air register faces. The vent stacks may be made of galvanized iron or flooring boards built up tight. This vent stack should be made to vent the first and second floor rooms. It is not essential that this stack run out of the roof. Let it empty into the attic and the vitiated air will find its way out. The hot air stacks should run from the cellar to 7 feet above the floor in each room, as shown in Fig. 2, which is an elevation giving dimensions. This will insure good circulation and uneven drafts will not be felt. If the building is up I would suggest running the pipe, as shown, in the cloak rooms. It would be better if they were well wrapped with asbestos paper and then cased in with some suitable material, such as ceiling boards or flooring. It would be well to place the register in the hall in the floor, as it will be a good place for pupils to warm their feet on entering the school building. I would recommend a brick set furnace for this job, rated by the manufacturers at 60,000 to 75,000 feet. I would further suggest that all hot air pipes be made of 26 or 28 gauge galvanized iron. Follow drawings and there will be no difficulty in heating the building satisfactorily.

RED PEPPER FOR RED ANTS.

From W. T., Peterboro, N. H.—In reply to the inquiry of "C. B. B." in *The Metal Worker* of September 14, I wish to say we have been troubled with ants until within the past six weeks. My wife has got rid of all kinds, big and little, red and black, by using carbolic acid. She has hunted for the holes and cracks, and then poured the carbolic acid in them. It is a certain fact that ants are not at work on our stock at present.

WHY WAS LEAD PIPE DESTROYED?

From S. & M., Piedmont, W. Va.—We have just received *The Metal Worker*, September 21, and having read the answer to our inquiry in regard to pitting of lead pipe, beg to thank you for the information. The suggestion in the answer of the fact that carbonic acid gas will eat lead pipe is no doubt the solution of the problem. These cinder banks in which the lead pipe was imbedded get very hot sometimes, and when they get wet emit large quantities of carbonic acid gas.

WANTS AN AQUARIUM.

From F. J. B., Tampa, Fla.—I desire to make an aquarium and hope that some reader of *The Metal Worker* who has made one will be kind enough to explain the construction and materials used, especially the cement, and give sketches, if necessary, showing the aquarium and how the different parts are joined.

The value to shipping interests of wireless telegraphy was proved last week by the Cunard steamer "Lucania," which, in her passage from New York to Liverpool, passed the steamer "Campania" of the same line coming in the other direction. Communication was enabled to be maintained between the two vessels in mid ocean for over two hours by means of their wireless telegraph instruments. The shortest distance in which communication was effected was 33 miles and the longest 65 miles. A number of messages were exchanged.

TRADE REPORT.

MARKET SUMMARY.

Pig Tin is firmer, but dull.

Copper prices are unchanged, but the market is quiet and rather unsettled.

Pig Lead is without change in price, and somewhat dull.

Spelter is slightly higher, but volume of business is light.

Antimony is unchanged.

Nickel remains firm and in good demand.

Aluminum is active and firm.

Tin Plates are still in short supply, with prices nominal.

Black Sheets continue scarce and prices rule high.

Galvanized Sheets are in better supply than Black and slightly lower in price.

Scrap Iron is in good demand and strong in price.

Sheet Copper is unchanged.

Sheet Zinc is in moderate demand at former prices.

Foundry Pig Iron is moving in large volume and prices are advancing.

Hardware business is active, and prices generally firm and unchanged.

Plumbers' Supplies are strong in price and business is active.

Wrought Iron Pipe is unchanged.

Plumbers' Brass Goods are in good demand, with prospect of prices holding.

Plumbers' Wood Work is scarce and strong in price.

Plumbers' Marble has been advanced in price.

Registers are stiffer in price.

Sheet Brass is firm and more uniform in price.

Copper Wire prices are very weak and irregular.

Block Tin Pipe has been marked down in price 2½c.

Wire Nails are active, with prices steady.

Cut Nails are unchanged.

Wire continues in sharp demand, with prices strong.

White Lead is in good demand; prices show some irregularity.

Linseed Oil is quiet; prices are without change.

Spirits Turpentine is firm and quiet.

Old Rubber is in moderate demand at former prices.

METAL MARKET.

NEW YORK, October 4, 1901.

Pig Tin.—While business was less active and prices rapidly declined in the early portion of the week, a reaction which set in on the London market on Wednesday caused a rise in prices in this market which brought them up to about the level of a week ago, leaving the market distinctly firmer at the close. Straits Pig, in small lots, is now quoted at 25¼c. to 26c. per lb. The statistical position of Tin at the opening of the month showed up a little better than was generally expected, but it seems that the heavy shipments from the Straits have taken the confidence out of the market on the other side, it being expected that these shipments will keep up in large volume during the rest of the year. The market here is in a peculiar condition. The Boston "bull" interests are loaded up with high priced stock for spot, and especially future, deliveries, while the consumers, by reason of a declining market, have covered their wants for this year, and in some instances even for the first quarter of next year. It is this condition that accounts for the lack of demand at present from consumers. The statistics for Europe and the United States, as compiled by the New York Metal Exchange, show:

Total visible supply September 30, 1901.....	Tons. 17,611
Against visible supply August 31, 1901.....	16,327
Against visible supply September 30, 1900.....	17,606

Copper.—No change has taken place in Copper conditions here. Consumers are still buying from hand to mouth, and where the delivery extends over any length of time, the purchaser is protected by a guarantee clause. It is said that the large consumers have been buying Lake Copper on this basis ever since the talk of the possibility of cutting prices began. Lake Ingot in small lots is generally quoted at 17¼c. to 17½c. per lb., and Casting Copper at 16¾c. to 17c. Owing to the low prices for spot and future deliveries in London, a heavy business was transacted there. And it is rumored that a good portion of this was done by parties who contemplated bringing it here for refining. The disappearance of the premium on futures is considered an unfavorable sign by merchants here. It is regarded as an indication that there is not much confidence in the future of the metal.

Sheet Copper.—Manufacturers and jobbers alike report that a fair demand continues for Sheet Copper, which generally exceeds that of former years at this season. Prices are held firmly on the basis of 21c. per lb. for moderate sized lots from store.

Pig Lead.—There are some lively rumors floating about in regard to the probability of a huge Lead combination. These rumors have served to unsettle the market, which already had been influenced by reports of overproduction and accumulation of stock. It is alleged that the American Smelting & Refining Company are carrying tremendous stocks of the metal. Parties in the trade, however, who keep close to existing conditions are not surprised to hear this, and do not regard it as of much moment. American Pig in small lots is quoted at 4.62½c. to 4¾c. per lb. St. Louis advices report the Pig Lead market there as quiet with a fair demand ruling, and prices the same as a week ago.

Spelter.—This metal is slowly advancing in price, but the volume of business is not increasing; in fact, the market is rather quiet. It is rumored that certain interests in the West are raising the price a little, in order to dispose of the surplus stock which accumulated during the Steel strike. Good Western brands in small lots are quoted at 4.45c. to 4.50c. per lb. St. Louis reports a continued heavy demand for Spelter in that market. Prices have shown some fluctuation, and the feeling prevails that from the present level prices are apt to go higher.

Sheet Zinc.—No change has taken place in the position of this article. Jobbers are quoting 600-lb. cask lots at 6¾c. per lb., and smaller quantities at 7c.

Antimony.—Is unchanged. Hallett's is quoted in small lots at 8½c. to 9¼c. per lb., and Cookson's at 10½c. to 11c.

Nickel.—There is no change in this metal. Prices are firm, small lots being quoted at 60c. to 65c. per lb.

Aluminum.—An active demand prevails for this metal, prices being the same as ruling for some time past. No. 1 Ingot, guaranteed over 99 per cent. pure, is quoted in small lots at 37c. per lb., and in 100-lb. lots at 35c.

Tin Plates.—There is nothing new to report in this market. The demand continues to be of a hand to mouth character. Large consumers, as a rule, are awaiting deliveries of orders placed by them before the strike occurred, while the smaller trade are buying only such supplies as they are in absolute need of, expecting that, with the resumption of work at the mills, the present high prices asked by jobbers will be very materially reduced. The current volume of trade is consequently quite light. Jobbers have not yet begun to receive shipments from the mills and their stocks are greatly depleted; in fact, the market is absolutely bare of some of the lighter gauges of Coke Plates and consumers are forced to purchase heavier Plates in cases where they must have material for immediate use. It will probably be several weeks before any sensible increase in the

stocks of Tin Plate is noticeable on the general market. Prices in this market are still entirely nominal. American Bessemer Coke Plates, I C, 14 x 20, are selling anywhere from \$6.50 to \$7.50, according to circumstances. A further slight decline in the price of Welsh Plates occurred this week.

Sheets.—The strike, so far as the Sheet trade is concerned, is a thing of the past. The output of Sheets at the present time is probably larger than ever before in the history of the trade. In spite of this it will take the mills several months to catch up with contracts. The feeling is, perhaps, a little easier, especially in the matter of Galvanized Sheets, but Black Sheets are as scarce or scarcer, than ever. There is still a wide range in prices, and the market is difficult to quote. Eastern jobbers quote No. 27, One Pass, Cold Rolled Soft Steel Sheets at about 4.15c. to 4.20c., and Galvanized Sheets at 60 and 10 per cent. to 65 per cent. off the list.

Chicago advices are as follows: With the exception of Stove Pipe sizes the demand from stock is not so urgent. Nevertheless stocks in local warehouses are so broken, and shipments from the mills are coming forward so slowly, that prices are still held up to top figures. Small lots are quoted at 4c. to 4.10c. for No. 27 Black Sheets and 60 and 5 to 65 off for Galvanized Sheets. The mills are reported to be oversold on No. 18 Sheets and heavier, and consumers are being advised that it will be some time before the supply will be adequate to the requirements of the market.

Old Metals.—A good demand still prevails for Scrap Iron. Other lines of Old Metals are rather quiet. Prices remain at about last week's level. Dealers are paying about the following prices for moderate sized lots, delivered at New York or corresponding points:

Heavy Copper.....	per lb.	14½c.
Light and Tinned Copper.....	per lb.	12½c.
Heavy Brass	per lb.	9 c.
Light Brass	per lb.	7½c.
Lead	per lb.	4 c.
Tea Lead	per lb.	3¼c.
Zinc	per lb.	2¾c.
No. 1 Pewter.....	per lb.	18½c.
No. 2 Pewter.....	per lb.	9 c.
Tin Plate Scrap, per gross ton.....		\$8.00
Wrought Iron Scrap, per gross ton.....		\$10.50 to 11.00
Heavy Cast Scrap, per gross ton.....		10.25 to 10.50
Stove Plate Scrap, per gross ton.....		7.25 to 7.50
Burnt Iron, per gross ton.....		5.00 to 5.50

THE PIG IRON MARKET.

NEW YORK.—Sellers report a moderate movement in this district. Melters generally report a good deal of activity, and the consumption seems active. Some of the leading furnace companies of Eastern Pennsylvania have taken so many orders that their stocks are being reduced quite rapidly. We quote: Lehigh, Schuylkill and Virginia Irons, No. 1, \$16 to \$17.50; No. 2 X, \$14.75 to \$15.75; No. 2 Plain, \$14 to \$14.50; Tennessee and Alabama brands, No. 1 Foundry, \$15 to \$15.50; No. 2 Foundry, \$14.75 to \$15; No. 1 Soft, \$14.75 to \$15; No. 2 Soft, \$14.50 to \$14.75; No. 3 Foundry, \$13.75 to \$14; No. 4 Foundry, \$13.50 to \$13.75.

CHICAGO.—The past week has been the heaviest in regard to tonnage placed under contract since early in the spring. The good condition of the Steel trade has evidently had an effect on Pig Iron buyers. The stiffening in Southern prices must also be credited with some little influence in improving the tone of the trade. All classes of consumers were represented among the buyers and much of the Iron was purchased for deliveries running through a considerable portion of next year. Many more inquiries are in the market and the coming week promises to be another period of large business. The Southern furnace companies have advanced their prices and quotations have been marked up accordingly. Northern furnace companies are reported to have made some concessions to the heaviest buyers and thus prices have been more nearly equalled. We quote as follows:

Lake Superior Charcoal.....	\$17.00 to \$18.00
Local Coke Foundry, No. 1.....	15.50 to 16.00
Local Coke Foundry, No. 2.....	15.00 to 15.50
Local Coke Foundry, No. 3.....	14.50 to 15.00
Local Scotch, No. 1.....	15.75 to 16.25
Ohio Strong Softeners, No. 1.....	16.00 to 16.50
Southern Silvery, according to Silcon.....	15.40 to 15.65
Southern Coke, No. 1.....	15.15 to 15.40
Southern Coke, No. 2.....	14.40 to 14.65

Southern Coke, No. 3.....	13.90 to 14.15
Southern Coke, No. 1 Soft.....	15.15 to 15.40
Southern Coke, No. 2 Soft.....	14.40 to 14.65

PHILADELPHIA.—A slight decrease in activity has been noticed during the past two or three days. There is still a good deal of inquiry for Iron, but large buyers are not disposed to go beyond the very inside figures, and in some instances they intimate that for long delivery they must do still better. In fact the market is disposed to relapse into dullness, and unless some new feature is developed it is likely to drift along for some time without much change in prices. Sales are reported at advanced quotations, as much as \$15.75 being paid for No. 2 X Foundry in some cases, but there is a fair supply of good Iron at \$15. Ordinarily, however, the market stands just about as it did a week ago. In a general way the range may be quoted as follows for city and nearby deliveries, and from 25c. to 50c. less at points within a radius of 100 miles South or West; No. 1 X Foundry, \$15.50 to \$16; No. 2 X Foundry, \$14.90 to \$15.50; No. 2 Plain, \$14.50 to \$14.75.

PITTSBURGH.—The Iron market is strong and the Bessemer Furnace Association are holding Bessemer Iron firmly at \$15.25, furnace. Foundry Iron is also reported to be firmer and in better demand. We quote No. 2 Foundry Iron at about \$14.25, Pittsburgh.

CINCINNATI.—Orders for Pig Iron have been pouring in and making a large volume of business during the week. There has been a general advance of 50c. a ton on all Southern grades, and on the basis of \$11, Birmingham, for No. 2, the market is strong and steady. Nearly all the tonnage placed is for the first half of next year, and there is a marked scarcity of Foundry grades for shipment this year. There will, in all likelihood, be a continuance of activity for some little time to come. We quote, f.o.b. Cincinnati:

Southern Coke, No. 1.....	to \$14.25
Southern Coke, No. 2.....	to 13.75
Southern Coke, No. 3.....	to 13.25
Southern Coke, No. 4.....	to 12.75
Southern Coke, No. 1 Soft.....	to 14.25
Southern Coke, No. 2 Soft.....	to 13.75
Southern Coke, Gray Forge.....	to 12.75
Southern Coke, Mottled.....	to 12.75
Ohio Silvery, No. 1.....	\$14.60 to 15.00
Ohio Silvery, No. 2.....	14.10 to 14.60
Lake Superior Coke, No. 1.....	15.10 to 15.35
Lake Superior Coke, No. 2.....	14.60 to 15.10
Lake Superior Coke, No. 3.....	14.10 to 14.60

ST. LOUIS.—The Pig Iron market has undergone a very material change for the better since last week, and a very brisk demand is now ruling. A general advance of 50c. per ton has been made in all grades by the furnaces. Some say that they have all they can handle to fill their orders for certain grades up to March. A few sales are reported at an advance over the new prices just made. We quote as follows for cash, f.o.b. St. Louis:

Southern, No. 1 Foundry.....	\$14.75 to \$15.00
Southern, No. 2 Foundry.....	14.00 to 14.25
Southern, No. 3 Foundry.....	13.50 to 13.75
Southern, No. 4 Foundry.....	13.00 to 13.25
No. 1 Soft.....	14.50 to 14.75
No. 2 Soft.....	14.00 to 14.50

CHICAGO REPORT.

Scrap Iron and Steel.—The volume of business is quite satisfactory. All classes of old material are in fair demand. Dealers quote the following buying prices, in carload lots, Chicago delivery:

	Per net ton.
Country Wrought Scrap.....	\$11.00 to \$12.00
Machinery Cast.....	10.50 to 11.00
Malleable Cast.....	10.00 to 11.00
Stove Plate (free from burnt).....	to 8.00
Burnt Iron and Grate Bars.....	5.50 to 6.00
Sheet Iron and Hoops.....	6.00 to 7.00
Plow Steel.....	to 10.00
Breaking Stock.....	9.00 to 10.00
No. 2, such as Shovels, Hoes, &c.....	to 7.00
Old Boilers—whole (Iron).....	6.00 to 7.00
Old Boilers (Iron) cut in single Sheets and Rings.....	9.50 to 10.00
Old Gas Pipe and Boiler Tubes.....	11.00 to 11.50
Cast Borings.....	4.25 to 4.50
Turnings.....	9.50 to 10.00
Horseshoes.....	to 13.00

Old Metals.—Copper and Brass are lower, but Zinc is a trifle higher. Trade is moderate. Dealers quote buying prices on small lots as follows:

	Per lb.
Copper Wire and Heavy.....	14½c.
Copper Bottoms.....	13 c.
Copper Clips.....	14 c.

Red Brass.....	13¼c.
Yellow Brass.....	9¼c.
Red Brass Borings.....	11¼c.
Yellow Brass Borings.....	8½c.
Light Brass.....	7½c.
Pipe Lead.....	4 c.
Tea Lead.....	3½c.
Zinc	2.80c.
Tin Foil.....	22 c.
Pewter, No. 1.....	19 c.
Pewter, No. 2.....	10 c.

Old Rubber.—A fair demand is reported. Dealers' buying prices are as follows:

	Per net ton.	Per lb.
Garden Hose.....	\$23.00
Alr Brake Hose.....	42.00
Rubber Shoes.....	7½c.
Rubber Car Springs.....	4¾c.
Inside Bicycle Tubing.....	21 c.
Outside Tubing.....	7¼c.
Black Rubber.....	4¼c.
White Rubber.....	8½c.

Rags.—Buying price of good country Mixed Rags, Chicago delivery, is 70c. to 80c. per 100 lbs., in any quantities.

Anthracite Coal.—Trade continues active. Better deliveries are now being made by the mining companies and the local supply is therefore in good shape. The schedule for carload lots is as follows:

	Grate.	Egg and Stove.
Chicago	\$5.75	\$6.00
Milwaukee, Wis.....	5.75	6.00
St. Louis.....	6.20	6.45
Kansas City, Mo.....	8.25	8.50

THE HARDWARE TRADE.

While business continues in excellent volume there is something of a lull in the demand made upon the manufacturers by the jobbing trade, whose requirements for the opening season have been liberally provided for. Reports from the retail trade indicate that trade with them is generally satisfactory, with the prospect that the next few months will be characterized by a large business, especially in holiday goods, a line to which many merchants will give more attention this year than ever before. The scarcity in some lines to which attention has been directed in recent issues still continues, as well as the uncertainty as to the future prices of others in which the formation of consolidations or combinations has resulted in the building up of outside competition, which threatens to become troublesome. The tone of the market, however, all things considered, is satisfactory. The meeting of the National Hardware Association at Cleveland next week is attracting a good deal of attention, as well as the endeavor on the part of a number of well-known manufacturers to form an organization at the same time. Another topic which is much discussed in trade circles is the project for the consolidation of jobbing interests.

NOTES ON PRICES.

Wrought Iron Pipe.—There has been no change whatever during the past week in the quotations on Wrought Iron Pipe. The outlook is that the present costs will be maintained for the next two or three months, and the chances are that mill costs will be held as at present to March of next year. The simple fact that the United States Steel Company are the makers of the Skelp from which the independent Pipe mills make their product is proof that the leading interest can keep matters within their own control.

Plumbers' Brass Work.—It is generally understood that there will be no change whatever in the price of Plumbers' Brass Work in the near future. It is said that some of the leading interests in the manufacturing business have visited the Copper people and have convinced them it would be to the best interests of the Copper dealers and the manufacturers that the price of Copper should remain at 17c. per lb., at least until January 1 next. It is said that many of the large manufacturers of Brass Goods have uncompleted orders on their books which were taken at prices based on Copper selling at 17c., and it would cause the cancellation of a great amount of business and considerable trouble and bad feeling were the price of Copper to undergo any ma-

terial reduction before the time mentioned above. It is a fact worthy of mention that the manufacturers of Brass Goods are not at present soliciting any new business. Whether this is due to their having enough business in hand to satisfy them or because they are waiting for the Copper cat to jump it is not possible to say.

Plumbers' Wood Work.—The scarcity of Tanks and Seats is one of the most remarkable phases of the supply trade in this vicinity. Very few of the jobbing houses are in a satisfactory position with this line. Stocks on hand are low and deliveries from the factories are not at all what they ought to be. Prices remain unchanged, and the prospect is they will continue so until the makers catch up with the demand and are again in a position to look for new business.

Sheet Brass.—Prices of Sheet and Roll Brass are now being held up quite firmly. There is little or no cutting, and the market is steadier than it has been for some time past. The demand is referred to as of good volume.

Copper Wire.—The market on Bare Copper Wire is greatly demoralized by competition. Prices have been cut to a ruinous degree in some cases, notwithstanding that the demand is of quite good proportions.

Registers.—Some of the Register manufacturers announce advanced prices to the smaller trade, quotations being based on the list issued under date September. There is a good deal of irregularity, however, in the quotations made by the manufacturers, and some very low quotations are still current, but the disposition is to obtain better prices in view of the unprofitable prices which have ruled throughout the year.

Wire Nails.—The demand throughout the country for Wire Nails is reported as large. Although manufacturers have increased their facilities they are not making as prompt shipments as the trade desires. In the New York market the demand has fallen off temporarily, which is not unusual at this time. The new tenement law is expected to curtail building operations in this city, and incidentally to affect the local consumption of Nails. Small lots of Wire Nails from store are quoted at \$2.60 per keg.

Cut Nails.—No change in the price of Cut Nails was made by the manufacturers at their meeting last week, but existing prices were reaffirmed. Reports point to some irregularity in prices. The New York Cut Nail market is unchanged in general features, small lots from store being quoted at \$2.18 to \$2.30 per keg.

Wire.—The demand for Wire continues moderately active. The mills are able to ship out their product about as fast as made. The tone of the market is fairly strong, but concessions in prices of Plain Wire are sometimes made for desirable orders and at competitive points. Prices rule at the same figures obtaining for some weeks past—viz., 2.60 cents for Plain Wire in small lots, and 3 cents for Galvanized.

Window Glass.—An improvement in the demand for Window Glass is reported, although it is not large. Stocks are being gradually reduced in jobbers' and manufacturers' hands, and are expected to be pretty well cleaned up by November 1, when factories are scheduled to begin operations. Prices are without change.

Linseed Oil.—The prices of Linseed Oil remain unchanged. Business is confined to small lots, because of the scarcity of Oil and a feeling that prices cannot long be maintained at the present level. It is thought that no relief can be expected, however, before the middle of the month, as it is questioned whether Oil on October contracts will be delivered promptly. City Raw Oil is retailed at 66 to 67 cents per gallon; Boiled Oil is 2 cents per gallon advance on Raw.

White Lead.—The demand for White Lead in Oil is good, if not up to expectations. It is reported that business in this line is in excess of the corresponding period last year. Some irregularity in prices is reported, but no change has been made in retail quotations, which rule at 7 to 7½ cents per pound for moderate sized quantities.

Spirits Turpentine.—The Turpentine market is firm at ruling prices, and only a moderate business is being done in small lots. Retail quantities of Turpentine are being sold at 37½ to 38 cents.

Old Rubber.—A moderate demand is reported. Prices are steady, dealers in New York and vicinity paying about the following figures:

Car Springs, ton lots, per lb.....	4¾c.
Rubber Shoes, less than carloads, per lb.....	7½c.
White Wringer Rolls, per lb.....	7¾c.
Inside Bicycle Tubing, per lb.....	21 c.
Outside Tubing, per lb.....	7¼c.

Cheap Lodging Houses in Milan, Italy.

In a recent report to the State Department, United States Consul William Jarvis, at Milan, Italy, gives a description of a cheap hotel or lodging house after the style of the well-known Rowton Houses in London or the Mills hotels in New York City, which has just been built and opened in Milan. The expense of the building has been provided by a society formed for the purpose. The hotel was opened June 18 and has been in working order for two months. It was at first thought that the majority of those who used it would be men of the laboring classes, but experience so far shows that almost the entire custom comes from the poorer paid clerks, shop assistants and others of that class.

The hotel is restricted to men only. The cost of a room is 10 cents per day, with an extra charge of 2 cents for bed linen, but if taken for a week the cost is 70 cents without the extra charge. There are 530 sleeping compartments, all of the same dimensions—viz., 5 feet 10 inches by 7 feet 6 inches, with divisions between the cubicles and corridor 7 feet 10 inches high, leaving a space of 2 feet between the division and the ceiling. Each room has a window 5 feet by 1 foot 10 inches. The furniture consists of a bed, chair and clothes pegs. Electric light is provided for use during the time for dressing and undressing. The floors of the bedrooms are made of cement, and all the partitions are enameled hollow cemented bricks. The whole edifice is heated by means of hot air pipes, and excellent sanitary arrangements are located on each floor. The bathrooms are open night and day for the use of the inmates, a complete bath costing 4 cents, while a shower bath can be taken for 2 cents. On the basement floor, near the bathrooms, are wash stands, consisting of marble slabs, in which the basins are fixed. Each basin has a hot and cold water tap and a discharge pipe underneath. A laundry is also provided in the basement. Access to the bedrooms is only allowed from 7 p.m. to midnight, and the lodgers are expected to leave the rooms not later than 9 o'clock in the morning. No personal possessions are permitted to be left in the rooms, store closets with separate keys being provided for each guest, where he may deposit all his clothing or other belongings.

The building is of five stories and basement, and the roof forms an extensive terrace. The architecture is described as simple but in good taste. In addition to the sleeping compartments there are large rooms reserved for dining, reading and smoking. All these rooms are lighted by electricity, the dining room being a particularly attractive apartment. To the dining room are joined two large kitchens with heat always ready. Each lodger is permitted to buy his own provisions outside and use the kitchens, the hotel providing the necessary cooking utensils. If desired, however, food may be bought ready prepared at the hotel at the cheapest possible price. The men may also do their own laundry work or have it done for them in the house at a fixed price.

LUND COMPANY have lately opened up in business at Cœur D'Alene, Idaho, and are carrying a stock including Hardware, Stoves, Tinware, Sporting Goods, Agricultural Implements, Buggies, Wagons, Harness, &c. They also have a plumbing department.

Richard A. Donaldson, for 25 years a member of the firm of Glina & Co., manufacturers of decorated tin-

ware in New York City, died on September 29 at his home, 97 Joralemon street, Brooklyn, N. Y. Mr. Donaldson was born in Brooklyn and lived there all his life. He had recently returned from an extended tour of Europe.

A letter from Lieutenant Peary, just published, shows that he succeeded in reaching a point further north than any other explorer who has worked on this side of the globe. But more important than this is the fact that he accomplished the mapping of the northern coast of Greenland. He found that the great island did not extend nearly as far north as had been supposed. Lieutenant Peary stays north another year.

Sheet Metal
Pattern Drafting

A course of instruction by mail for tinsmiths, coppersmiths, plumbers, sheet-iron workers, furnace workers, skylight makers and others that will enable a student to "strike out" working patterns for all kinds of sheet metal work. This is what a student says:

His Course
More Than
Paid for Itself

I am a tinsmith, and consider your course in Sheet Metal Pattern Drafting one of the best investments I ever made. Before I was half through I had realized from it more than the money paid for the whole course.
M. E. TOBIAS,
63 Fifteenth St.,
Wheeling, W. Va.

We teach by mail Mechanical, Steam, Electrical, Civil and Mining Engineering; Shop and Foundry Practice; Mechanical Drawing; Architecture; Plumbing; Sheet Metal Work; Telephony; Telegraphy; Chemistry; Ornamental Design; Lettering; Book-keeping; Stenography; Teaching; English Branches; Locomotive Running; Electrotherapeutics. When writing state subject in which interested.

taught by mail.

DIETZ

Nos 30 and 60 SEARCH LIGHT

COX. ENG. N. Y.

DIETZ Nos. 30 and 60 TUBULAR SEARCH LIGHTS.

These Lamps are made for out-door or in-door use. They give a powerful and brilliant light, and are not affected by the wind.

They are suitable for use in mills, workshops, warehouses, stables and summer resorts, or in any other place where a good light is required which will not be affected by strong breezes.

Where it is desired to light up a long row of animals, or a long narrow room of any kind, these lamps are especially desirable.

No. 30 is fitted with our patent bull's-eye lens on perforated plate, adding to the appearance of the light.

No. 30 has a No. 0 globe, 1-in. wick and a bright tin reflector 12 inches in diameter.

No. 60 has a No. 2 globe, 1½-in. wick and a bright tin reflector 16 ins. in diameter.

—MADE BY—

THE REEVES MANUFACTURING CO.,

Canal Dover, Ohio.

A UNIVERSAL REMEDY FOR LEAKY ROOFS.

The valuable qualities of a good roofing cement are firm adhesiveness and elasticity. These qualities the American Seal Builders' and Roofers' Elastic Oil Cement possesses. It will adhere firmly to Slate or Metal and will not crack or crumble. It is especially recommended for repairing leaks around chimneys, dormer windows, skylights, scuttles, firewalls and any place that requires fixing on a roof, either Slate, Tin or Shingle.

This Cement will answer to repair a roof when Solder cannot be used.

PUT UP In Barrels, about 800 lbs. In Tubs, about 112 lbs. In 25 and 50 lb. Pails. In 5, 10 and 15 lb. Pails.

Special Discount to Jobbers and Large Buyers.

STAMPING THE PLATES.

Securing the right results in stamping Metal Ceilings is not so easy as a great many people think.

The dies must be accurate and have the proper amount of draw.

The metal sheets must be of the right temper—properly annealed—tough, not brittle; added to which is required time, skill and patience on the part of the pressman to successfully do the work.

Especially is this the case with deep, bold stampings, which must be brought out gradually, by successive operations, and with greatest care.

Failure to comply with these conditions means spoiled material, insufficient stamping and imperfect plates.

A notable feature of Berger's Classic Metal Ceilings is the high order of stamping that they display. You don't have to guess what the design is. It stands out in bold relief.

By devoting careful study and expert attention to the various details; from start to finish, we have succeeded in raising the standard for this class of work; and in producing stampings clear, clean-cut and true to detail, and of depth and boldness once thought to be unattainable.

Compare our regular work with the regular work of others and judge for yourself if we are right.

Galesburg Cornice Works,

GALESBURG, ILLS.

The New Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting
as applied to all branches
of sheet metal work.

Cloth Bound, Price \$5.

This work contains a collection of 218 problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added 75 new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

- I. Terms and Definitions—15 pages.
- II. Drawing Instruments and Materials—13 pages.
- III. Linear Drawing—6 pages.
- IV. Geometrical Problems—35 pages.
- V. PRINCIPLES OF PATTERN CUTTING—25 pages.
- VI. PATTERN PROBLEMS (3 Sections)—325 pages.
 1. MITER CUTTING,
 2. FLARING WORK,
 3. TRIANGULATION.

All Tanners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

The New Metal Worker Pattern Book.

Price \$5, post or expressage paid.

DAVID WILLIAMS COMPANY,
PUBLISHERS,

The Double Truss Cornice Brake.

All the different sizes in which we make this practical machine are herewith illustrated.

This brake costs only half as much as an all-metal brake.

It is made mostly of hard maple.

It is just as good as an iron brake in every respect—much better in some ways. Beside the \$4 saved in the first cost our brake will save money in its use.

It is light and can easily be carried from place to place.

By shaping or bending work in the building where it is to be used all the trouble and expense of handling formed-up work is saved.

Write for prices.

96 inches long.

CORNICE MAKERS' SQUARING SHEARS.
With Lever Arc, Automatic Gauge. Will cut No. 22 iron
97 inches long.

HERCULES SHEARS

make the cutting of sheet metal of heavy gauges an easy task for the mechanic and a profitable operation for the employer. With them a man can cut No. 12 steel with one hand on the lever, leaving the other hand free to guide the stock while cutting elbows, ties and circles, as small as 8 in. radius; this is done without burring or buckling either piece, thus avoiding hammering and straightening, which add to the cost of the product. They split sheets of any width or length up to No. 12 gauge, cut wire or bar-steel $\frac{1}{8}$ inch thick, cut off and mitre angle iron $\frac{1}{8}$ inch thick, and do it perfectly.

PRICE, - - \$35.00.

★ SAWS ★

Our Star Hack Saws are now used in nearly all Iron-working Shops the world over. They are equally useful for farmers and men in all departments of life. They will cut iron and wood equally well. A nail does not dull them at all. One blade, which costs five cents, will cut off an inch square bar of iron 200 times without sharpening. We have cut off such a bar 337 times with one blade. All hardware dealers will furnish these saws. If not, we will send one steel frame and six blades by mail, prepaid, on receipt of \$1.00.

All good blades are stamped with a ★
MILLERS FALLS CO., 28 Warren St., N. Y.

— VILLAGE LOAFER (to the factory lodge-keeper): "Ony danger o' a job the day, Jimmy?"

Jimmy: "Ay, mon, there is a job. Wait a meenit, and I'll speak for ye to the foreman."

Loafer: "Oh! ye needna bother, Jimmy. I'll come back the mornin' and see if onybody else has got it."—Moonshine.

— INDEFINITE INSTRUCTIONS.—Lady (to clerk in clothing store): "I want a pair of trousers for my husband."

Clerk: "What size, madam?"

Lady: "I don't know the size, but he wears a 15 collar."—Exchange.

The Main Top

OF THE

New Model Grand Range

Is devoted entirely to cooking space. On the ordinary range one quarter of the top is taken up by the smoke pipe collar. By an ingenious arrangement of the smoke flue in the 20th Century Model Grand, all the space which is thus usually wasted is available for cooking utensils—making each hole in the top equally serviceable.

Paragon Point No. 6.—PERFECT ADAPTABILITY.

While hard coal is mostly used in the Paragon Furnace, we make it to burn soft coal as well, and pea coal or coke can be burned in any size and any style. The Paragon line is also adapted to low cellars, and we have a form of it for bricksetting. We also make a combination Paragon with either steel or cast iron radiators.

This point means that whatever your requirements may be in the furnace line, you need not go outside of the Paragon Furnace catalog to meet them.

and

Denver.

Do you want to sell a good Number One, Medium-Priced Range that will Roast and Bake with the best of them? If you do then do not be persuaded to carry anything but the...

GEM-MILLER STEEL-PLATE RANGE.

Which are far superior to other so-called first-class Ranges as to Roasting, Baking and Durability that are made.

WITH improved removable Duplex Grate, improved Water Back for heating water, Flue Lined with Pure Asbestos Board, New Non-Warping Oven Bottoms, Cold-Handled Gravity Latch, Drop Oven and Feed Door, Patent Double Centers, Regulating Damper, Nickel-Plated Towel Rod. All bright parts Nickeled instead of Polished. Nickel Bands on doors are ventilated to prevent tarnishing, and body of Ranges are highly finished.

Special attention is called to the easy manner of Removing and Replacing the Grates and Grate Frames in these Ranges without interfering with the Water Backs or Linings. Simply by taking out the small bolt and removing the Front Grate the entire Bottom Grate and Frame can be drawn out through the Front Draft Door.

MODEL RADIATOR.

There's Money in the Magee Ranges

YOU know—or ought to know—that there's more money, in the end, in an article that satisfies **EVERY** buyer, and satisfies **ALL THE TIME**, than in one that is sold not on its merits, but because it is "cheap," and that will not—can not—give lasting satisfaction. This is truer of cooking apparatus than of most things.

When a dealer sells an article intended for immediate consumption and it doesn't come up to expectations, the consumer may eventually forget about it.

But not so with a range or cook stove. The user isn't only dissatisfied the first time she tries it—she has 365 disappointments a year. It's every day she thinks hard things about the stove and about the man who sold it. She's apt to say uncomplimentary things about both to neighbors and friends—things that are not going to help the sale of stoves, or of anything else in the store.

You'd better sit down and put some hard thinking into the matter before making your selection of ranges and cook stoves.

Think

Magee

and
you'll
make no
mistake.

Think if you've ever heard of a Magee disappointing anyone.

Think of the Magee agents you may happen to know in other localities—have't they all found there's money in Magee Ranges?

"RELIABLE"

STOVES and RANGES

represent the highest type of perfection in stove construction. They are far superior to all others in points of style, finish, durability and economy in the use of fuel.

"RELIABLE" STEEL RANGE BODIES are made of Wood's best blued polished steel, thoroughly lined with sheet asbestos and steel plate. Bottom oven plate is protected with two thicknesses of asbestos and three thicknesses of steel; also a two inch dead air space. This construction insures economy of fuel.

Our removable duplex grate is the best and our sectional fire pot is a proven success.

Our **"RELIABLE" OIL HEATERS** are too well known to necessitate our setting forth their many advantages over others. Suffice it to say they bear the name "RELIABLE."

Twenty-three years of continued success in stove making and the past reputation of the "RELIABLE" is our best guarantee for the future. They have given universal satisfaction to thousands in the past, and will to you.

This Is The Line That Never Disappoints.

Keep your eye open for our **1902** line of **Gas** and **Vapor** cooking and heating appliances. We have some rare surprises in store for you later on.

The Stanton Seamless Heater, PORTABLE CASD.

THE STANTON HEATER CO.,
 Louisville, Ky., Apl. 5th, 1901.

Martin's Ferry, Ohio.
 Gentlemen:—Your favor of the 8d inst. is received asking our experience with the Stanton Heater which you put in for us during the fall of 1899. In reply we will say that it gives us pleasure to express our entire satisfaction with this Furnace. While we have had no severe weather this winter there have been several quite cold snaps, but our offices have been very comfortably heated, and our coal bill (Pittsburgh coal) has been quite moderate compared with other Heaters we have used.

The satisfaction the Heater has given us can be best expressed by saying that we have not heard the Furnace mentioned once this winter. You can see, therefore, that we have had absolutely no cause for complaint.

Yours very truly

UTICA HEATER COMPANY, - - UTICA, N. Y.
Chicago Heater & Supply Co., Western Managers, 54 Dearborn St., Chicago, Ill.

PARIS HILLS, MAINE, October 2, 1901.

DIGHTON FURNACE CO.,

GENTLEMEN: Yours of the 28th ult. received.

There are two "DIGHTON" Furnaces in our village, which have given good satisfaction. One was put in last year, the other the year before.

We think we want the No. 21 as our rooms are much larger than the others.

Our old Furnace was a ——— (well known name), fire pot was 22 inches and never has given very good satisfaction, that is, we do not think we get the heat from it that we ought to and have been troubled with gas for the last three or four years.

How long ought a Furnace to last with good care and not run to its utmost capacity; and from the information which you already have as to size and number of rooms, can you tell us how much coal we ought to burn from November to the middle of May?

Should we decide to order a No. 21 "DIGHTON" the first of next week, when ought we to receive it in South Paris?

Yours respectfully,

STILL IN THE LEAD!

**L. J. MUELLER FURNACE CO.,**

Established 1857.

190 Reed St.,

MILWAUKEE, WIS

Front Rank Hot Air Furnaces

are built on vertical lines; air comes in direct contact with entire heating surface.

The Front Rank Fire Chamber is one solid sheet of closely riveted steel; being lined above the fire lines with genuine fire clay tiling it is the most durable made.

The radiators are very large and have an unusual area of heating surface in comparison with the size of fire pot.

These furnaces burn hard or soft coal or coke. We also make wood burning furnaces.

Send for our catalogue, it will give you a better idea of what we make.

BRIEN HEATER CO.
HOOSICK FALLS, N. Y.

Furnace Heating.

A Practical and Comprehensive Treatise on Warming Buildings with Hot Air, by William G. Snow, with an Appendix on Furnace Fittings. 170 pages; size, 6 x 9 inches. Cloth bound. Price, \$1.50.

This is the only book that has been brought out which presents a systematic and reliable treatment of the warm air furnace system of heating.

It deals with the various types of furnaces, their construction, proper location and setting, together with furnace fittings, and all matters pertaining to the installation of furnaces and to effective and economical heating by warm air. The subject is discussed for the first time by a competent author possessed of a scientific education and a practical training, who presents positive rules, based on a long experience, for guidance in designing furnace systems for dwellings and other buildings where this popular method is employed. The various details of furnace work are described simply and at such length that the volume will be valuable to all who are in any way interested in the subject. It is recommended to practical furnacemen, to architects, builders and house owners, and to tanners and plumbers in suburban sections who do furnace work. To all these it will prove a reliable text-book and guide.

PARTIAL SUMMARY OF CONTENTS BY CHAPTERS.

Chapter I.—Furnaces—Is devoted to Furnace Construction—The Relative Proportion of Furnace Parts—Secondary Heating Surface—Economy and Efficiency—Heating Capacity and Exposed Wall Surface—Manufacturers' Ratings of Their Own Productions, etc.

Chapter II.—House Heating—Compares Furnaces and other apparatus, and describes Method of Setting Brick and Portable Furnaces—Location and Area of Cold Air Supply—Cold Air Rooms and Air Filters—Return Ducts and Air Circulation—Size of Hot Air Pipes—Location of Registers, etc.

Chapter III.—The Combination System—Discusses Heating Distant Rooms with Radiators—Balancing the System—Location of Water Heater in Furnace—Capacity of Water Heaters—Size of Radiators, etc.

Chapter IV.—Air—Deals with the Necessity of Ventilation—Water Needed to Moisten Air—Expansion of Air—Velocity of Air in Tubes, etc.

Chapter V.—Heating and Ventilation of Buildings—Considers the Size of Furnaces Required—Fresh Air Room and Supply—Air Circulation—Size of Flues—Use of Stack Heaters—Size of Heating Coils in Vent Flues, etc.

Chapter VI.—Heating of Public Buildings, Churches and Stores—Is given to the Size of Furnaces Required—Grate Surface in Ventilated Buildings—Air Supply—Size of Heating and Ventilating Flues—Size of Stack Heater, etc.

Chapter VII.—Fan-Furnace Combination System—Is devoted to Positive Warm Currents from Fan Systems—Location of Fan and Driving Apparatus—How Good Furnaces are Aided by Fans—Types and Efficiency of Fans—Area of Ducts and Flues, etc.

Chapter VIII.—Temperature Control.

Chapter IX.—Estimate and Contract Blanks.

Chapter X.—Value of Fuels. The Proper Size for Furnace Chimneys—with tables.

APPENDIX.

Furnace Fittings.—A section of 45 pages dealing with the Making of Furnace Casings—Metal Cold Air Boxes—Making Furnace Bonnets and Collars—Making Pipe and Elbows—Registers Boxes and Stack Shoes, etc.

Sent postpaid on receipt of price, \$1.50.

We have not only stood the test of time, but look at the
result of physical test of Quimby Engineering Company before
Building Committee, on competition for public work in an
Eastern city.

QUIMBY ENGINEERING COMPANY.

PHILADELPHIA, PA., Aug. 5, 1901.

MESSRS. J. H. McLain Co., Canton, O.

Gentlemen:—We hereby certify that one-half section of
the Cornell Boiler was tested by us to destruction to-day, and
that it was ruptured at Two Hundred and Fifty Pounds per
square inch hydraulic pressure. Very respectfully yours,

QUIMBY ENGINEERING CO.,

Attest: JOHN M. LUKENS, H. H. Quimby, Proprietor.
(Chief of Bureau of Steam Engine and Boiler Inspection, City of
Philadelphia.)

It Clearly Puts Our "Cornell" IN A CLASS BY ITSELF.

Think of it—250 pounds pressure on a Cast Iron Boiler.
This is the only kind of Boiler that is good enough for you.
We make all our Boilers of the different styles the same way—
the right way.

Have you our new Booklet, "Truth About Heating?"

A 62-PAGE PAMPHLET

Comprising a Series of
Articles and Letters on
*Chimney Troubles
and Their Remedies*
published under the title

Contains a compilation from the col-
umns of THE METAL WORKER, of arti-
cles and correspondence relating to
house chimneys, defective flues, and
kindred topics, comprising a source of
information of the most practical and
reliable nature, on overcoming difficul-
ties which occur in the working of
chimneys, flues, etc.

To all who are interested in flues
and drafts, in their relation to
stoves, furnaces and house heating ap-
paratus, this book will prove instruc-
tive and helpful.

The Contents are as follows

	Page.
POINTS ON CHIMNEYS . . .	7-32
An illustrated article by J. L. Bixby, Jr., describing many details in chimneys, which cause trouble, and giving remedies. An important table is presented, of the sizes of chimneys required in dwelling houses, based upon the amount of work to be done.	
DEFECTIVE FLUES . . .	33-35
This article presents information resulting from a wide, practical experience of the writer, and gives sound advice on some of the details of chimney construction.	
HOW TO IMPROVE A WEAK CHIMNEY . . .	36-40
VARIOUS FORMS OF VENTILATORS or CHIMNEY TOPS	41-45
CONDENSATION IN STOVE PIPES . . .	46, 47
SMOKE PIPE FOR WOOD FURNACES . . .	48
REMEDYING DOWN DRAFT IN CHIMNEY . . .	49-51
CONNECTED FLUES DESTROY DRAFT . . .	52-55
FAILS TO BAKE ON BOTTOM	56-62

40 good Illustrations help
to make the Text clear.

The G. S. BLODGETT CO., Burlington, Vt., U. S. A

can hold my hand over my chimney. No waste heat. I use a Rochester Radiator and save half the fuel.

The greatest leak in household economy is the loss of heat up the chimney. This was supposed to be unavoidable until the **Rochester Radiator** was invented; now it is cheaply and thoroughly controlled by the many cross tubes. Dealers find an ever growing trade. Why not put in a stock and get up a boom in your town?

—AN INSTANCE TO THE CONTRARY.—
Mrs. Vick-Senn: "It makes you tired
to carry the baby because you have
let yourself become soft and flabby
from lack of exercise. When I went
to school I learned in my physiology
that the way to make the muscles large
and strong is to give them regular exer-
cise."

Mr. Senn: "It won't always work.
The muscles of your jaw are no larger
or stronger now, after 16 years of con-
stant exercise, than they were when I
first became acquainted with them."—
Chicago Tribune.

—"Lor', I'd never trust anybody
called Alias. 'Ere's Alias Wilkins,
Alias Blackley, Alias Picklock and
Alias Nighthawk, all 'ad up for steal-
in'."—*Scraps.*

—"WHAT is the plural of man,
Johnny?" asked the teacher of a small
pupil.

"Men," answered Johnny.

"Correct," said the teacher. "And
what is the plural of child?"

"Twins!" was the logical, but un-
expected reply.—*Exchange.*

The YANKEE Hot Air DAMPER (Improved All Steel.)

THE YANKEE EXCELS.

Above All—Cheapness—a dealer cannot possibly make dampers as cheaply as we sell the Yankee. Easily put in and taken out of pipes. Stiffest, quickest-working and neatest damper on the market.

ROD POINTS: Has wood enameled handle. Wood handle cannot come off. Washer and spring cannot fall off the rod. Same size of holes are punched on each side of pipe. Rod is made of $\frac{1}{4}$ inch cold-rolled steel and slips into damper very smoothly. Sample sent to any Dealer without charge.

It is impossible for this rod, when in position, to move either way.

The S. M. HOWES CO., Manufacturers, 40-46 UNION ST., Boston, Mass.

Sizes: 6, 7, 8, 8 $\frac{1}{2}$, 9, 10, 10 $\frac{1}{2}$, 11, 12, 12 $\frac{1}{2}$, 14 and 15.

Opening of the Trade School Season.

The attention of many young men who are ambitious to master some trade as a means of securing a livelihood is now directed to the trade school, this being the time when most of these schools open their course of instruction for the winter season. The advantages derived by those who take a trade school course are demonstrated in the popularity of such institutions wherever they are in operation. When a young man receives instruction in his chosen trade under the superintendence of an expert, who explains the best methods of doing work and watches the pupil so that none of the bad habits of independent study are acquired, it is not strange that the pupil acquires a remarkable degree of proficiency, not only in handling the tools, but in giving a finish to his work that is fully equal to that shown in general practice. From the fact that the courses of instruction almost always include a series of lectures dwelling in detail on the principles involved and explaining the reason for doing work in a given way, it can be readily seen that a knowledge of the trade in all its details, both theoretical and practical, may be impressed indelibly upon the mind of the student in a comparatively short time, while if left to be gained from practical experience in the regular way many important features might still be left untouched. Next Monday night a new season opens at the New York Trade School, which has been the most successful and popular of these institutions. Following the example set by Colonel Anchmuty in founding this institution, several similar schools have been put in operation in the metropolitan district. In a number of other large cities, however, movements to secure trade schools have not met with the same success as has attended the New York Trade School. This is unfortunate for, in view of the passing of the old apprentice system for training young men in the manual arts, the trade school is doing an invaluable work as a substitute for that system. The opposition which has been raised to trade schools on the ground that the ranks of the different trades are already sufficiently filled and the trade school product menaces the livelihood of journeymen already in the field, when viewed in a broad, liberal way, will not be considered a sufficient reason for delaying the early establishment of a well equipped trade school in all of the larger cities. The first consideration should be given to the coming man. It is essential to his moral as well as his physical welfare that he should be as well equipped as possible with the

means of supporting himself in a manner useful to the community. While trade schools already exist in several cities and there is evidence that the number is to increase, their growth has by no means kept pace with the demand. The manual training school as a part of the common school educational system, the trade school and the advanced technical school are all parts of a new educational system that cannot be too widely adopted in a progressive country.

Pig Iron Production Increasing.

The monthly blast furnace statistics of *The Iron Age* show a moderate increase in the capacity of the active plants on October 1, as compared with the figures for September 1. At the opening of this month there were 246 pig iron furnaces in blast, with an aggregate weekly capacity of 307,982 gross tons, as against 255 furnaces with a capacity of 299,861 tons on the first of last month. This increase is due principally to the resumption of a few important plants in the Central West, some of which were idle during the strike, and to the starting of the large new blast furnace of the Sharon Steel Company. Meanwhile, a number of smaller furnaces have gone out of blast. Notwithstanding this increase in output, furnace stocks declined from 380,074 tons on September 1 to 361,593 tons on October 1, a decrease of nearly 20,000 tons. This shows the statistical position of pig iron to be exceedingly strong. Indeed, for months past the country, as regards pig iron, has been running on very close to the wind. It is doubtful whether there is more than two weeks' stock of pig iron in producers' hands at the present time, which is a very narrow margin to provide against accidents or contingencies, particularly since it is known that consumers are carrying very little iron. Business in all classes of iron products is manifestly in a very good condition, and there is some idea that higher prices may be looked for. The feeling among some of the larger interests, however, is that values are now as high as is reasonable. In fact, the belief is more and more frequently expressed that, so far as the iron trade is concerned, we are on the crest of the wave, and that it will be doing well if the present level of prices can be maintained.

The Earnings of the United States Steel Corporation.

The recent report of the earnings of the United States Steel Corporation for the first six months of their existence has brought out a flood of comment and commendation. Yet the figures have been received by many with a reserve bordering on disbelief, chiefly because the earnings for August and September failed to show any falling off as the result of the strike. No official explanation of the data presented was given, but we understand that the earnings of the months affected by the strike would have been very much larger but for that struggle. The earnings of the United States Steel Corporation are the aggregate of the profits made by the constituent interests. A preliminary estimate is made by each of these concerns on the basis of the actual returns for the first twenty-five days of the month, and

this was the figure adopted for September. Past experience has shown that the methods of accounting are so complete that, barring accidents, the preliminary figures vary but very little from the final returns. The earnings of the constituent companies are based on the shipments of product. Therefore the concerns affected by the strike who continued to ship product from stock continued to show earnings even after they had largely ceased production. A peculiarly interesting point in connection with the figures submitted, however, is that the earnings of the ore mining and transportation interests were particularly heavy during the months when a part of the finishing capacity was idle. There went into the earnings, therefore, the profits on hauling by railroad and transporting by the lakes ore which will not enter into the manufacture of iron for months to come. The earnings of the United States Steel Corporation will be swelled during the season of navigation by those shipments and it was the returns from this source which went far toward obscuring the effect of the strike. Of course the tonnage of finished material which it was impossible to deliver owing to idleness will go to increase the receipts during the winter period, when usually the demand is somewhat slack.

Radiator Valves.

Some little stir was caused a while ago among the manufacturers and distributors of radiator valves by irregularities which prevailed in the prices of these goods in certain localities. At some points in the East these valves were quoted at prices at which they could not be replaced, and various heating contractors were fortunate in being able to buy stock at figures at which the manufacturers were selling to jobbers. This condition, however, seems to have changed of late. At the present time manufacturers of radiator valves report all the business they can handle at prices in advance of the quotations that made the stir. Owing to the various grades of these goods on the market, it is not out of place to suggest to the steam fitter, particularly at this time, that he should be sure of the quality of the valves quoted to him at low prices. It is well known to all experienced men in the trade that there are radiator valves and radiator valves. Some steam fitters, who enjoy special consideration for their bld's, never use any but the best valves; others are apt to buy their supplies in the cheapest market, irrespective of quality. Some valves have a full and ample body of good metal of approved design and first-class workmanship and finish. There are also valves made for a given size of pipe, but having bodies no larger than valves of standard grades one size smaller. In the latter case, even though the metal and workmanship may be good, the valves must either be unable to stand the higher pressure or else they are restricted in their passages. In either case they are not worth the lower prices quoted in comparison with the heavier goods. There are plenty of good full sized valves on the market, and the steam fitter should not furnish a scant pattern to his customers for the sake of the few cents that are saved thereby.

Apparatus for Using Oil as Fuel.

Since Texas and California have become oil producing States there has been a considerable demand for apparatus for using this oil for fuel purposes, owing to the high cost of ordinary fuel—coal and wood—in those sections. Already some success has been attained in the equipment of locomotives and power plants with suita-

ble burners for this purpose. The problem of equipping such apparatus has now come to the engineer and its solution may be safely left with him. There is an equally important demand for a simple, safe and economical method of using this same fuel in the cooking stove, heating stove, hot air furnace and boiler used for the heating of buildings. Inasmuch as these domestic appliances are quite generally left in the charge of the women folks it is essential that the equipment of the kitchen stove, in particular, must be simple so as to be readily understood and operated, and safe beyond the requirements of the boiler room of the power plant. Prior to the advent of natural gas, and since it has become the popular fuel in the Central West, many power plants were equipped with a successful fuel oil burning apparatus. Efforts to similarly equip the heating and cooking apparatus in the home are not wanting, and it is probable that some of those who have failed to find the encouragement in the old fields may secure success in the newer fields by adapting their devices to the requirements of the local fuels. The stove dealer and plumber will naturally be called upon to equip stoves and heating apparatus with such burners and they can be relied upon to lend their assistance if reliable fuel oil burners are brought to their attention. Already the stove dealers and plumbers in these fields are making inquiry as to where reliable apparatus of this character can be secured, which is a reflection of the demand made upon them by their customers.

Business failures in the United States, reported by *Dun's Review* for the first nine months of 1901, number 8144, with an aggregate indebtedness of \$97,856,416. In the same months of 1900 the number of failures was smaller, 7895, but the amount of liabilities was much heavier, \$133,234,988. There were 1906 failures of manufacturing concerns in the first nine months of this year, with an indebtedness of \$32,758,427, against 1759 for \$27,222,855 last year, and 5842 traders suspended owing \$35,320,511, against 5694 last year for \$39,564,781. Thus it appears that, despite the numerous small failures, the aggregate indebtedness of the failing concerns was much lighter this year than in 1900. One explanation of the increase in the number of failures appears to be that the general prosperity of the country encouraged a number of persons to embark in business on their own account without sufficient capital or experience, and lacking, consequently, qualifications that are indispensable to success.

Higher Commercial Education in Canada.

In response to an invitation addressed by the Governor-General of Canada to the various universities of the Dominion to take into consideration the question of higher commercial education, the authorities of the University of Toronto have arranged for a two-year course of study along that line. The course is not that of a business college, but one calculated to give a better mental training, a broader outlook and considerable information valuable and necessary to a modern business man. The subjects embrace commercial geography and industrial history (trades unions, trusts, &c.); wages and prices; tariffs and transportation; banking organization, and commercial law, which form one group of study. A second division consists of chemistry, electricity, geology or mineralogy, history and principles of architecture or mechanical drawing, commercial mathematics. A third is represented by languages, English composition and a study of some English authors, and any two of the modern languages, French, German, Italian and Spanish. Any person may attend the lectures by the payment of a small fee. The Toronto Board of Trade has donated \$250 by way of prizes for students taking the highest standing in the course.

GEORGE W. WALKER.

The death of George Willis Walker, president of the Walker & Pratt Mfg. Company of Boston, Mass., removes one of the most prominent and highly respected members of the New England stove trade. Mr. Walker died on Friday, October 4, at his residence in Malden, Mass. He was born August 27, 1827, in Exeter, about 20 miles west of Bangor, Maine, and was educated in the public schools of that place. He worked upon his father's farm until he was 18 years of age, when he left home to seek his fortune. In 1845 he went to Boston with only \$6 in his pocket, but with an unlimited amount of strength and perseverance. After three years of hard struggle for a living he became clerk in a stove store. Subsequently, he was employed by three different stove dealers in Boston, each one of whom was employed by him at a later period. In 1853 he accepted a position of responsibility with Johnson, Cox & Fuller of Troy,

GEORGE W. WALKER.

N. Y., predecessors of the Fuller & Warren Company. After five years in Troy, where he was married in 1857 to Miss Elizabeth Kinnicutt, he returned to Boston to engage independently in the stove and furnace business. Mr. Walker opened a store at 15 Union street and soon established a substantial business. He passed through a number of crises in the financial world without failure of any kind. Subsequently he removed to 31-35 Union street, where for more than a quarter of a century the Walker & Pratt Mfg. Company have done an extensive business. Mr. Walker was the president and chief executive of the company since their formation in 1874. He possessed a marked inventive ability, and few men in the trade brought out so many new and valuable devices and improved construction in connection with stoves, furnaces and heaters. Mr. Walker in many ways was a pioneer in the stove manufacturing industry and was a recognized leader in the constructive as well as in the selling department of the business.

In 1869 he established his residence in Malden, and his home became a center for the cultivated people of the town. His wife died in 1879, and he subsequently married Mrs. Doreas E. Hagar of Malden. Mr. Walker held many public offices in his town, serving as chairman of the Board of Selectmen, as Sinking Fund Commissioner, Water Commissioner and trustee of the Malden Public Library. He represented the city of Malden in the

State Legislature in 1885 and 1886, and served as a Presidential Elector in 1892. Among his associates were many men of note in the State and in the country, and he held the warm esteem and affection of a large circle of business, political and social friends. He was a member and generous supporter of the First Congregational Church in Malden and was also very prominent in Masonic circles. A widow, three daughters and a son survive him. The latter, A. W. Walker, is a member of the Walker & Pratt Company. The funeral, which was held in his late home in Malden on Sunday, October 6, was attended by several hundred persons, including delegations from various public bodies with which he was connected, the Mayor of Malden and the members of the city government, and a committee, composed of A. N. Parlin, E. A. Stevens, B. P. Lovejoy and D. W. Cushing, especially representing the stove trade of Boston. The interment was made the next day at the family lot in Woodlawn Cemetery.

At a meeting of the manufacturers and dealers in heating and cooking apparatus, with A. N. Parlin as chairman, held on Saturday, October 5, at the office of the Magee Furnace Company in Boston, to take action on the death of Mr. Walker, the following resolutions were unanimously adopted:

Whereas, God, in his Providence, has called from us our friend and business associate, George W. Walker, it is with sincere sorrow that we meet to mourn the loss of one who for more than 40 years has been conspicuous in all the activities pertaining to our line of business, and it is hereby

Resolved, That we desire to place on record a tribute to his memory. A man of sterling integrity and unblemished reputation, in social as well as business life, he has always held the complete confidence and esteem of all his associates, and we feel that he will long be missed from the place he has so ably filled. We offer to his family our fullest sympathy in their affliction, but rejoice with them and his many friends that he leaves behind him the memory of a life well spent, and a reputation of which they may well be proud.

Resolved, That these resolutions be spread upon the records, and copy of same be sent to the family of the deceased, and also published in the daily papers.

THE WESTERN STOVE TRADE.

All Western stove manufacturers report a continuance of the highly gratifying conditions which have been prevailing in the trade for several weeks. The demand is not only large, but is developing the scarcity in some classes of stoves which was pointed out in these columns during the summer as very likely to occur. It was seen at that time that dealers were not anticipating their fall requirements to the extent which seemed to be justified by the conditions prevailing in the general iron and steel trades. The stove business not only depends on the disposition of the dealer to place orders, but it also depends for its satisfactory course upon the ease with which necessary materials can be obtained. The strikes during the summer months caused considerable interruption to the delivery of some very important materials which are needed by stove manufacturers in finishing their goods for the market.

Present appearances lead experienced manufacturers to believe that this year will prove to be one of the greatest ever known in the stove business. The past may have seen periods in which prices were much higher and profits were decidedly greater, and when some establishments did a considerably heavier business than they will do this year, but, taking the trade as a whole, the volume of business will be exceedingly heavy and, in comparison with some experiences in the past, the results in the way of profits will be fairly satisfactory. This belief in an unusually satisfactory year is based, of course, on the expectation that the good demand for stoves will not only extend through the present month, but will also be continued well into November.

Matters are now shaping themselves for an advance at the beginning of the coming year in sheet goods and possibly in cast goods. While some manufacturers of steel ranges and oak stoves have been obliged to withdraw their lowest discounts, because of the short supply of sheet steel, which compelled them to pay high prices

for what they were able to pick up, it seems that the great majority had so provided themselves with good stocks that they were able to go through the season without feeling the necessity of advancing their prices. When the conditions now obtaining are faced for another season they will be more inclined to consider the increased cost of manufacturing and are very likely to decide that an advance in the selling price will be necessary. This may bring about also some stiffening in the prices of cast goods, even if pig iron is not so much higher in price as to compel an advance on that account. Southern foundry pig iron, which enters so largely into the production of Western stoves, now brings 75 cents to \$1 per ton more than the prices ruling four weeks since, and the tendency still appears to be upward as a consequence of the heavy buying movement coming from all classes of consumers.

PROPOSED STOVE MANUFACTURERS' STEEL PLANT.

Those who attended the annual meeting of the National Association of Stove Manufacturers at Boston will remember the address of President Stanhope Boal, and his allusion to the use of sheet steel by stove manufacturers. The excellent suggestion made by Mr. Boal has been taken up, says the *Leader-Dispatch* of Piqua, Ohio, and a company are being formed who will probably have a number of stove manufacturers as stockholders. It is said to be the intention of such a company to build a plant, at a cost of about \$750,000, to consist of open hearth furnaces, rolling mills and planishing and galvanizing works, capable of manufacturing the various grades of steel now used by stove, furnace and range manufacturers. Men who are thoroughly familiar with the manufacture of refined, planished and polished steel and other grades of sheets are said to be largely interested in the formation of this company as stockholders and officers in the management of the plant, which will have a capacity for an annual output of about 25,000 tons.

Stove manufacturers have complained of their inability to obtain the highly finished sheets used in some goods, owing to their being manufactured at comparatively few mills, so that orders must be placed several months ahead in order to obtain stock. This trouble was especially emphasized during the recent strike. Mr. Boal's suggestion is that the plant be run on the co-operative plan, the product to be consumed by the stockholders of the company, and any profit that may be derived to be paid back in dividends.

Garland Heating Stoves for Wood.

The Michigan Stove Company have issued a special number of their *Garland Magazine*, devoted to heating stoves for wood. The stoves illustrated in this publication are the Fireside-Garland, Premium-Garland, Yale-Garland and Horizontal Oak-Garland. The Fireside-Garland is presented as a new departure in wood heaters. It has an oblong body made of sheet steel, presenting a broadside front, with ornamental cast base and cast top and a nickeled foot rest in front. Three styles are made—namely, with top feed, with end feed and with grate and ash pan—thus satisfying all requirements. It is fitted with the company's own air tight joint and is claimed to have remarkable fire retaining qualities. The Premium-Garland is an oval air tight, having a sheet steel body, cast iron top and base, a highly ornamental cast iron front, extending from top to bottom, and a nickeled foot rest on each side.

The Yale-Garland has a square cast body of ornamental pattern, full nickeled top and base, a mica front with a nickeled reflector above and a nickeled foot rest in front. It is made with grate and ash pan, or with solid bottom. Heat is thrown to the base through flues in the front of the stove. The Horizontal Oak-Garland is a direct draft and revertible fine stove of the Todd type, largely constructed of cast iron in ornamental patterns, having an urn on top and a nickeled foot rest on

the side. The body is made of Wood's cold rolled boiler iron. A hot air circulating fine enables it to be converted into a double heater for heating another room.

The Highland Oak.

One of the latest additions to the extensive line of heating stoves to which the Buckwalter Stove Company of Royersford, Pa., are directing the attention of the trade is the Highland Oak, a full revertible flue construction for which strong claims are made. It is intended for using as fuel hard coal, soft coal, coke, wood or any other material of a combustible nature. The ornamentation is rich and effective, nickel playing an important feature in the embellishment of the exterior. In its construction an air tube or duct encircles the top of the fire pot, admitting heated air in small jets into the fire chamber to mingle with the gases liberated from the fuel. This results, it is claimed, in a perfect combustion and active consumption of the gases, thereby converting them into heat instead of allowing them to escape unconsumed to the smoke flue. The company claim that this fuel gas generating device contributes greatly to efficiency, economy, cleanliness and healthfulness. The fire pot is heavy and durable, yet, when desired, the company can furnish either brick or cast iron linings. The upper door can be furnished solid or with mica illumination and is provided with a shield to prevent the escape of the smoke into the room when the feed door is thrown open. The ash pit is large, the magazine of extra capacity, the cam damper is a feature of both feed and ash doors and the outside body of the stove is of heavy planished iron. The Highland Oak is made both as a single and double heater and is offered in three sizes fitted with the well-known Ransome duplex grate.

Thatcher Furnaces.

The last of the new catalogues of the Thatcher Furnace Company, 240 Water street, New York, which has just made its appearance, relates to the Thatcher warm air furnace. It was preceded by a catalogue devoted to the Thatcher steam and hot water heaters, and another to Thatcher ranges. The furnace catalogue consists of 40 pages, 10½ x 7½ inches in size, bound in a light brown cover, having a design in a three-color effect. The introduction calls attention to the steady popularity of the Thatcher furnaces from their conception. The place of honor in the catalogue is given to the Thatcher tubular furnace, in which the exposure of a large heating surface is a characteristic feature. The fire pot is of what is known as the Porcupine type, being covered with prong extensions, which prevent the overheating of the fire pot and utilize the heat by transmitting it to the air which comes in contact with it. The combustion chamber has an increased heating surface through the passage through it of a series of boiler tube flues. The air in passing through the furnace not only passes over the outer surface, but up through these hot air flues. The gases from the combustion chamber rise through a series of flues to a circular radiator. Broken views of the construction are presented, so that the indirect passage of the products of combustion may be followed, and also the air travel. The furnaces are adapted for either portable or brick setting. A large double page engraving shows two portable furnaces connected together at the top in battery form for large work. This furnace is made in eight sizes, six of which are provided with a water heating apparatus, to be used as a combination heater. A special grate construction is provided, which facilitates ease in the care of the fire. It also provides for the entrance of a large quantity of air to the fire to promote combustion. This feature of the furnace has been found to be very popular with those who use it, and to add very materially to its efficiency.

The Winner is a new furnace recently brought out by the house. It consists of a corrugated fire pot with a large combustion chamber having flues leading into the circular cast iron radiator. The Scorching furnace is one with an established reputation, having a cast iron fire pot and a steel radiator. The Meteor and the Active are fur-

naces designed for those who have to meet sharp competition in their trade.

Several pages are devoted to the Miller patent ventilating system, for use in connection with hot air furnaces, by means of which the foul air is exhausted from the various rooms of a building, aiding the heating by facilitating the inflow of fresh, warm air. An engraving shows a furnace equipped with this system connected with one room in which the air, by absence of a tint, is shown to be perfectly fresh, and connected with another room in which there is an open grate for ventilation, showing by the tint that only the upper portion of the room is ventilated, while the effect in the hall, which is not ventilated by the Miller system or the grate, is illustrated by the darker tint of that apartment. Another page gives the plan of the basement, with a complete heating and ventilating system.

A number of pages are occupied by useful information to furnacemen in selecting the size of cold air ducts, arriving at the capacity of a furnace, with the number of hot air pipes it will supply, the dimensions of brick cold air pits, and other suggestions of a practical character. A complete price-list, with cuts of registers and ventilators, is presented. On the closing pages are printed several testimonials, which are presented in a unique manner, well calculated to attract the attention and interest of the prospective purchaser. On the last page is a general view of the company's extensive manufacturing plant, at Newark, N. J.

The Quincy Foundry & Novelty Company.

We have received from the Quincy Foundry & Novelty Company of Quincy, Ill., a copy of their catalogue for the season of 1901-1902, relating to the leading lines of steel cook stoves and heaters which they manufacture. They call special attention to the Noxall, a steel cook stove intended for using coal or wood as a fuel. It is made of heavy polished blue steel, has extra large pouch feed, Duplex grate, cast flue back and flue strips, spring balanced oven door, large ash pan, extension fire box for wood and is lined throughout with asbestos mill board. One of the important features of this stove is the square oven finished in aluminum. The claim is made that the stove occupies less space in a kitchen than a steel range, while furnishing equal cooking facilities. Some interesting comments are presented on the subject of air tight heaters for wood, illustrations being presented showing an extensive assortment of these goods. Attention is also called to the Keepsake cast top wood heating stoves, and also to the Eclipse air tight circulating heater, intended for using coal as a fuel.

ODD PLATES.

We are advised by the Michigan Stove Company that Garland Stoves and Ranges were awarded first prize and the only gold medal at the Pan-American Exposition, now in progress at Buffalo.

"WHY THE COOK PREFERS THE CRAWFORD," is the title of an interesting pamphlet which is being distributed by the Walker & Pratt Mfg. Company, 31-35 Union street, Boston, Mass. The Crawford Range is illustrated and described at considerable length, each illustration showing the cook pointing to the particular feature described in the text beneath. Testimonial letters from teachers of cooking and housekeeping are given showing the estimation in which the Crawford is held by them. Accompanying the pamphlet is a circular showing the Crawford Oak Stove, designed for using wood, coal or, as the manufacturers put it, "anything that will burn," as a fuel. The Stove is referred to as being of new design and rich ornamentation. The fire pot is deep and heavy, like that of a furnace; the grates are strong and durable and are of two styles, draw center and triangular. There is an ample clinker space for poking and slicing the bottom of the fire; the draft wicket is operated by a screw and closes air tight, and the heavy steel body of the Stove is tightly fitted at top and bottom.

At the County Fair, held the last week in September,

the Lehigh Stove & Mfg. Company of Lehigh, Pa., had a very interesting exhibit of high class Ranges and Heating Stoves, which were the center of attraction to a large number of visitors. The exhibit included, among others, the Home Lehigh, New Lehigh, Orient Lehigh, Alma Lehigh, Rose Lehigh and Glen Lehigh. One of the features of construction to which special attention was drawn by the representatives of the company was the Star Sectional Perforated Cover, a device recently patented and which has been applied to the Lehigh line of Ranges. The perforated cover consists, in reality, of two covers, one within the other, the inner one being perforated. The point is made that by the use of this cover the coal gas cannot escape into the room, as there is always a down draft through the perforations. When the fire is fixed for the night the inside covers may be left off as far as necessary, thus deadening the fire and arresting unnecessary combustion of fuel. The first week of October the company also exhibited their goods at the Allentown Fair, where they won many favorable comments.

WM. RESOR & Co., Cincinnati, Ohio, have issued a daintily printed little pamphlet calling attention to a few of the many Monitor Ranges and Heaters which they manufacture. The special points embodied in the Monitor Steel Ranges are covered in a way to interest the enterprising dealer, while the comments upon the Monitor Gas Range are such as to bring out prominently its important constructive features. The Monitor Base Burner, for hard coal, is the leading number of the company's High Art series of Parlor Stoves, and is offered in three sizes. The Monitor Oak is shown in its new dress for 1901. While it is of graceful proportions and handsome ornamentation it embodies the latest features of internal arrangement. The Monitor Hot Blast, made in three sizes, for coal, is illustrated and described, as is also the Peerless Oak.

FRANK BRIELMAIR, formerly with Bridgeford & Co., Louisville, Ky., informs us that he has engaged with F. & L. Kahn & Brothers, Hamilton, Ohio, as foreman of their Steel Range and Sheet Iron Working department.

A FOUR-PAGE FOLDER, which is being sent out by the Enterprise Stove Company, Vincennes, Ind., calls attention to the Domestic Star Steel Range and to the Star Radiator, a handsomely ornamented Parlor Heater. The Range is offered in several sizes and the usual modifications. It is of attractive exterior, nickel being judiciously employed, and forms a striking contrast to the dark surfaces of the Stove. The Star Radiator, the company point out, is not an "air tight," but is constructed on entirely different principles. It is made in two grades, and as a single and double heater.

THE STANDARD STEEL RANGE MFG. COMPANY, Cleveland, Ohio, are sending out a 30-page pamphlet calling attention to the Standard line of Ranges, which they manufacture in many varieties. The important features of construction are described in a way to interest the trade, and there are also general instructions for operating a Stove in order to get the best results. The goods shown are of attractive exterior and embody the latest improvements. They are offered in several sizes to meet varying requirements. A feature of the publication is illustrations of the fire boxes used in the World's Standard and Standard, Jr., lines. The catalogue is neatly printed and bound in illuminated covers, the design representing a Standard Steel Range in operation.

THE KALAMAZOO STOVE COMPANY, Kalamazoo, Mich., contemplate the erection of a brick factory, 122 x 300 feet in size and two stories in height, which is estimated to cost \$65,000.

THE PURE AIR STOVE COMPANY is the name of a concern recently incorporated at Philadelphia, Pa., with a capital stock of \$2000.

THE JOLIET STOVE WORKS, Joliet, Ill., suffered some damage from a fire which occurred in their factory on Friday night, October 4. The company advise us that it is impossible at this time to determine what the exact damage may be. While this damage is considerable, they state that shipments of Stoves will not be interrupted to any extent. A fire in a manufacturing estab-

ishment is always unwelcome, but coming at this time of the year in a Stove works it is particularly unfortunate. We are pleased to learn that the company's operations will not be seriously interfered with. The dispatches sent out from Joliet to the daily press have, as usual, very greatly exaggerated this occurrence. The company have a very large clientage, who will be glad to know that the trouble is by no means so great as the reports which have been sent out would indicate.

COLEBROOK'S Asbestos Furnace Cement and Stove Putty forms the subject of an illustrated blotter, which is being distributed by W. H. Colebrook Sons & Co., Syracuse, N. Y. The Cement is put up in all sizes of removable cover cans, tubs, barrels and half barrels.

AYLING BROTHERS, 14 Haddon avenue, Chicago, Ill., report that their trade in A B Stove Polish, both liquid and dry, has been very large, some of the largest Stove manufacturers, as well as dealers, duplicating their orders constantly, showing that they are well satisfied with the preparation. The firm's plant is now complete with the latest machinery and modern improvements. They are provided with 16,730 square feet of ground, with 10,000 feet of working floor space, and are able to fill all orders promptly.

We are advised by the Utica Heater Company, manufacturers of the Superior Steel Furnaces, Utica Heaters and a very extensive line of Heating Apparatus, that their exceptional facilities and good stock on hand enable them to make shipments the same day order is received. This promptness in filling orders appears to be appreciated by the trade at large, from the fact that the Utica Heater Company during August and September nearly doubled their business, as compared with the corresponding months last year. To maintain the reputation of the company for prompt shipments their plant has been run nightly since early in August.

THE AMERICAN STOVE & RANGE COMPANY, Keokuk, Iowa, report a large demand for their well-known line of Stoves and Ranges.

HARPER & MUNSELL, who have heretofore been conducting a Hardware business at Cameron, Mo., are reported by a local paper to have sold their Hardware business with the purpose of devoting their entire attention to the manufacture of Stoves.

A LETTER from the Michigan Vapor Stove Company, Grand Rapids, Mich., informs us that L. E. Ambrose will again travel in the interest of their goods in Illinois and Iowa.

THE DANVILLE STOVE & MFG. COMPANY, Danville, Pa., are bringing their Beaver Square Parlor Heater to the attention of the Stove dealer by means of a pink circular printed in red and black. The Stove is of pleasing design, elaborately nickel trimmed, and has a large mica illumination. Its merits are a full revertible flue construction, a hot air chamber for heating an upper room, a convenient grate and a construction that is easy to repair when natural wear makes it necessary. It thus has all the essentials to enable the dealer to push it with confidence and satisfaction to all concerned.

STOVE dealers who sell Gas Heaters should secure one of the 28 x 41 inch hangers of the Ideal Gas Heater, issued by the Ideal Mfg. Company, Detroit, Mich. It is printed in red and black on a yellow ground and shows the trade-mark of the house under the words "Ideal Gas Heater" in large letters. The picture shows one of the Heaters, 30 inches high, with a little girl and a fox terrier beside it. The hanger is well calculated to suggest to all who see it the usefulness and convenience of a Gas Heater. Another hanger of the same size in olive, red and black presents as conspicuously the desirability of possessing an Ideal Gas Range, which is made with baking oven, broiler, top burners and all the usual conveniences.

THE PITTSBURGH STOVE & RANGE COMPANY, Pittsburgh, Pa., are sending to the trade a four-page folder showing half-tone engravings of the Corona Cinderella, a handsome square Parlor Heater. The design is very pleasing and the Stove is elaborately embellished with nickel plating. An exceptionally large mica illumination is also a feature. The beauty of the Stove is

equaled by its features of merit, which includes a base burner of full revertible flue construction and arranged for heating an upper room by means of hot air. The folder enumerates the excellent points of the stove, which has every qualification of leadership on the sample floor of the Stove dealer catering for the best trade.

A CIRCULAR issued by the Quincy Stove Mfg. Company of Quincy, Ill., calls attention to some of their most recent productions in the way of Heaters. Prominent among these is the Novel Monogram, an attractive Todd Stove made in two sizes and having a capacity for burning wood 20 and 24 inches in length. The construction, which is referred to by the manufacturers as something entirely novel, is such that the heat circulates between the linings and the jacket the same as in a horizontal Todd. Another novelty is the Bi-Me Monogram, belonging to the same general class of Stoves. This Stove is also made in two sizes, but has a capacity for burning wood 22 and 26 inches in length. It has large front feed, cast top and bottom, cast linings, polished steel body, ash guard under the feed door, screw damper and steel top ring. The circular also calls attention to the Quincy Beauty, the Quincy Faultless and the Quincy Peerless, the latter resembling an Oak Stove in its general appearance.

Combined Check and Voucher.

Logan-Gregg Hardware Company, Pittsburgh, Pa., to both simplify and shorten routine office work as to receipts for remittances, have for some time been using a form of bank check, here reproduced, which is also designed as a voucher or record of the transaction for future reference. What they claim for this method is that in one document is shown the amount paid, when, by whom, to whom, what for and through what channels. When the check is returned to the issuing bank and ultimately to the merchant the canceled paper, on which it is intended the dates of invoices paid shall appear, when practicable, proves that the creditor or payee received the money and renders unnecessary the sending of a separate receipt. Some favorable features are the discontinuance of formal letters acknowledging the remittance, the saving of time, labor, paper, envelopes and postage, which in large corporations or businesses is important, while subsequent reference shows at a glance the main parts of the entire transaction in one compact paper of uniform size, which is easily filed, stored and cared for. The form can be made to meet special conditions, but the one herewith serves for ordinary transactions.

Form (Reduced) of Combination Check and Voucher.

GEO. H. CLARKSON has bought the Hardware, Stove and Sporting Goods business of J. F. Hortenstein, Laredo, Mo., and will continue at the old stand.

MEARS & CALHOUN have succeeded Mears & Bowlin, Cashion, O. T., dealers in Shelf and Heavy Hardware, Stoves and Tinware, Agricultural Implements, Buggies and Wagons. The new firm are enlarging the store, and when the improvements under way are completed its dimensions will be 40 x 80 feet.

THE NATIONAL HARDWARE ASSOCIATION.

The seventh annual convention of the National Hardware Association opened on Wednesday at the Hotel Hollenden, Cleveland, Ohio, with a good attendance of delegates and a larger representation of manufacturers than at any former jobbers' convention.

The convention was called to order by the president, Richard W. Shapleigh, J. H. Van Newkirk of the Russell & Erwin Mfg. Company was elected secretary of the convention. President Shapleigh delivered an especially interesting and able address, covering the work of the association in the past year, the benefits derived therefrom and the outlook for trade in the future.

Secretary-Treasurer T. James Fernley, in his annual report, said that fewer complaints against manufacturers had been received during the past year than ever before, and that a gratifying increase had taken place in the membership of the association.

THE ECONOMICAL DISTRIBUTION OF GOODS.

An interesting collocation in regard to the most economical distribution of goods was then held. The speakers agreed that this can be best done through the jobbing trade, but a number of points were brought out relating to matters in which the jobbers were regarded as not serving the manufacturers' interest, such as their unwillingness to introduce new goods, using special brands in many lines, instead of manufacturers' brands, and failure in many cases to maintain manufacturers' prices to the retailers. Addresses on this subject were made by William Bates, sales manager of the Kirk-Latty Mfg. Company; William Powell, treasurer of the Columbian Hardware Company; G. E. Needham of the Garry Iron & Steel Company and others. Mr. Needham's address, which touched more particularly upon conditions connected with sheet metal goods, was as follows:

The subject you have assigned to me for discussion is "How Can Manufacturers of Hardware and Kindred Lines Most Economically Distribute Their Products?" In considering this question and giving my views, it seems to me that some light may be obtained by relating my experiences along these lines for over 30 years, and they may be of some interest, if not amusement, to the members of this convention.

It is said that "Experience is a good schoolmaster." I think in my case this saying has been verified. My experience was not along the lines of hardware, but kindred lines—viz.: Iron and steel roofing, sidings, ceilings, conductor pipe, eaves trough, &c. Our company, the Garry Iron & Steel Roofing Company, were among the first to commence this business, and may be considered the pioneer manufacturers of the above named material, therefore it became my business to market our products. The question came to my mind, "What will be the best and most economical way to dispose of them?" Metal sheets were well known, but not for roofing purposes; it therefore became necessary to educate the public to their practical use for purposes designed, and who should be the schoolmaster? Knowing the ability of jobbers for this work, I sought to make arrangements with them for this purpose. They kindly and gently informed me that a demand for them must first be created before they would or could do anything with them. These were the old school jobbers, doing business on the slow motive power, hence the demand had to be created, which was done through other sources; the consumer, the tinner and the retailer. The demand did come and came in enormous proportions, as evidenced by the thousands of tons of sheet metal that are used for these products yearly at the present time. The demands have been made, conditions for handling manufactured product are changed, business is being done on the high pressure and rapid transit principle. Now the question arises, "What is the cheapest, quickest and most practical way of marketing our goods?" The demand has been created—now the demand is, "What is the best and most feasible way of taking care of this demand?"

In looking the field over I am satisfied that this problem can be solved through the agency of the jobber. When we take into consideration their ways and means and their willingness, providing we give them the money end of the business, to handle our products, we, as manufacturers, are forced to admit that the proper solution of the question is in favor of the jobber.

With their great army of traveling salesmen, composed of men of brains, business ability, tact and energy, going into every city, town and hamlet, daily and al-

most hourly, the jobber has pre-eminently the advantage over any other system that at this time presents itself to my mind for selling and distributing goods.

I think I am within the bounds of truth when I say that your association is the largest and most influential, representing the largest amount of capital, of any commercial organization in the country. I am in favor of association of this character, for it enlarges men's views by interchange of thoughts and ideas, destroys petty jealousies and lifts men on a higher plane of business principles, establishing harmony among the members and securing the confidence of your customers and the good will of the public.

In conclusion I wish to say that a closer and more harmonious business relationship should exist between the manufacturer and the jobber. Their relations should be placed on the base of live and let live, in perfect harmony and justice, on the universal brotherhood of man, and founded on the eternal principle of "Doing unto others as you would have others do unto you."

SESSION OF METAL DEALERS.

After the morning session the members of the association dealing in tin plate and metals met for a brief conference.

OUTLOOK FOR THE FUTURE.

An interesting address was made before the association by Frank Dickerson, general sales agent of the American Tin Plate Company, New York, on "The Outlook for the Approaching Year; Will the Present Range of Prices Probably Prevail?" Among other things, Mr. Dickerson said:

This year of grace that is now drawing to a close is the third year of good business and large profits; but who shall say that there are to be four more? There may be, and I hope there will be. Others will say that the panic years of the past century were 1817, 1837, 1857, 1873 and 1893—intervals of 20 years in every case except one, when the interval was 16 years. Those who would argue from these statistics will tell you that we need not look for a severe shrinkage in values until 1909 at the earliest, and possibly not until 1913. Such optimism may be correct, and I hope that it may be, although I shall be satisfied if the great prosperity of the past three years shall reach the magic number of seven.

INFLUENCE OF COMPETITION.

The commercial sky is clear to-day and business is good. The clouds are so few as to be scarcely in sight. There is prospect of competition in some lines, and competition affects prices very quickly. Often the prospect of a lively competitor coming into the market will reduce prices materially before the goods are on the market. Very large and heavy competition will reduce prices until there is no profit to the manufacturer, and in an experience of 20 years as a merchant I have found that the merchant's profits were best when the manufacturer's profits were best; when the manufacturer made little or nothing, the merchant's profits were also little or nothing. Gentlemen, I do not say this because I represent a manufacturing company, but because in my experience this is true. Probably every one present can testify that there is more money in selling some one article than in selling some others, and if you investigate I think you will find that the profitable article is invariably one that pays the manufacturer handsomely. The article which pays but little profit to the merchant is sold by the manufacturer usually very near the cost. If there be in this, my experience, a hint not to be too ready to encourage competition, I trust that those who hear will profit thereby.

FUTURE PROSPECTS.

I do not wish to weary you with statistics and details, but in a general way to refer to the fact that the conditions of trade and commerce are much the same now as they were a year ago. True, the harvest this year may fall short of that of 1900, but when all is gathered and the aggregate summed up, I believe that the difference will be so slight as not to interfere with the prospects of good business for many months to come. Railroad earnings are fully up to 1900, and in nearly all lines of business the outlook is good, so that in the words of the hymn we may say, "Every prospect pleases, and only man is vile." When earnings are large and money is plentiful people spend freely and prices have an advancing tendency, and this is one reason why the optimist now looks for higher prices during the coming year. We are all willing to acknowledge the truth of this, but as high prices tend to diminish consumption, it has ever been the policy of the best managed of the larger manufacturing companies to be most conservative in advancing prices. The next six months will undoubtedly see some goods at higher prices than those now ruling, and it is not impossible that other

goods are too high to-day, and that lower prices will prevail; but in the main it seems to me as most probable that the present level of values will continue for some little time to come.

Asbestos Sad Iron.

The Dover Mfg. Company, Canal Dover, Ohio, are offering the sad iron shown in the accompanying cuts. It is made in two parts—the core or iron proper, and its hood, or cover, with the necessary handle. The core is described as a solid block of the best obtainable iron, retaining the heat and providing the weight necessary

Fig. 1.—Asbestos Sad Iron.

to secure a high polish on the work with the least possible muscular effort. The core is referred to as being heavily nickel plated, and its face as being ground absolutely true, and finely polished. The hood is a neatly fitting nickel plated cap, which slips over the core, its lower edge resting upon the projecting flange of the core, to which it is instantly and rigidly secured by a locking device. This is alluded to as being made of a high grade spring steel, simple in construction, positive in action, and so firmly securing the hood to the core that it can only be detached by the operator. The entire surface on the inside of the hood is lined with asbestos, to serve the double purpose of preventing the walls of the hood becoming unduly heated, and at the same time to retain the heat in the core by completely screening it, when in use, from air currents. It is remarked that the dead air space between the upper surface of the core and hood materially supplements the

Fig. 2.—Baby Sad Iron.

nonconducting asbestos lining. As the hood is never upon the core, except when the iron is being used, it is pointed out that it cannot become heated, and is readily kept clean and bright at all times. The handle is attached to a broad shield of sheet metal. The shield, while firmly secured to the hood, is so arranged that a wide air space intervenes between the upper surface of the hood and the under side of the shield. This construction, in connection with the asbestos lining, is to eliminate any possibility of the handle becoming more than slightly warm. In designing the handle especial care was taken to secure one that should neatly fit a lady's hand. The covers, shields and springs are referred to as being copper plated before nickeling to secure what is known as never rust plate. The manufacturers guarantee the irons to be perfect throughout, and replace broken or defective parts free of charge. A set of laundry irons consists of one handle and asbestos lined cover combined, three interchangeable cores or bottoms, and one asbestos covered stand, the complete set weighing 16 pounds. A set of tourist irons consists

of one handle and cover combined, one core or bottom and a stand. A set of the baby iron, Fig. 2, includes the same number of pieces, and weighs about 1¼ pounds.

The Turner Little Wonder Light.

The Turner Brass Works, 122 East Kinzie street, Chicago, have embarked in the manufacture of vapor lamps on an extensive scale and have just brought out the Turner Little Wonder light, which is herewith illustrated. It is of the under generator type and represents, it is claimed, the most advanced ideas which have so far been produced in vapor lamps. The lamp in ap-

pearance may seem to differ but little from other recently invented lighting appliances, but important changes have been made in its mechanism. The globe font or base is a nickel plated bowl made of 18 gauge copper, which is lined with block tin to effectively pre-

The Turner Little Wonder Light.

vent the gasoline corroding the copper, and is guaranteed to stand a pressure of 110 pounds. Through a small brass tube inserted in the bowl, the gasoline is forced up to the burner by air pressure. The lower end of this tube rests upon the inner base of the bowl, while the upper end terminates in the generator. Surrounding the generator is a small asbestos lined cup, into which a teaspoonful of wood alcohol is poured, and a

match is applied to generate the heat in starting the light. A double filling plug, termed a filler and air plug, located on the side of the bowl, is the means by which the lamp is replenished. This plug is entirely removed from the aperture in pouring the gasoline into the bowl, and when it is again fastened in place a small thumb screw piercing its center is slightly loosened, a rubber tube is connected to it, and the air is pumped in to whatever force is desired. This lamp is claimed to be the only gasoline lamp using an automatic cleaning valve. A small steel needle is so arranged that at each half turn of the cut off valve the needle passes into the orifice of the burner, and at the next half turn it is withdrawn. The motion is the same, turning either right or left, after having opened the valve a few turns. It thus moves automatically in its process, removing the carbon at the base of the burner and thus preventing the latter clogging. It does not come in contact with the extinguishing rod and cannot in any way turn the light out. This improvement favorably impressed the inspectors of the Iowa State Insurance Board. The lamp is adapted for use in any interior lighting, especially in large establishments, public resorts, stores, &c., but can be used as effectively in the open air as within doors. It gives a 500-candle-power light.

Stove and Hardware Dealers.

THE RIPLEY HARDWARE COMPANY, Grafton, Ill., are calling attention to the Rippley Whitewashing and Painting Machine, which they are placing upon the market. The company point out that there is nothing that will light up a barn, mill, warehouse or factory like a good coat of clean white paint, or, better still, white-wash. The great difficulty is the expense, and this is the problem that they claim to have solved with their Compressed Air Sprayer. The original and important feature that makes this Sprayer especially efficient is the air compressor, which in one minute's pumping creates sufficient pressure to discharge the entire contents in a fine mist or continued stream, as desired, thus greatly accelerating the painting of inside walls and ceilings, as well as materially cheapening the cost of the operation. The Rippley Whitewashing and Painting Machine is furnished in two sizes, of 8 gallons and 16 gallons, and is substantially made of galvanized iron. The machine is equally good for outside work and handles all kinds of materials effectively. The company will be glad to furnish catalogues and descriptive matter upon application.

THE NATIONAL ENAMELING & STAMPING COMPANY, New York, are calling the attention of the trade to a select line of Coal Vases illustrated in their Catalogue No. 1, on pages 568, 569 and 570. In addition to the line illustrated in their catalogue, the company make some special decorations in the blended effect which have proved great favorites with the trade, and these beautifully decorated Coal Vases are in large demand. As this is the season of the year when these goods are purchased, the company invite dealers who have not already laid in a stock to write for prices and information regarding these goods. Catalogues of their complete line will be furnished on application.

THE WAY HARDWARE CORPORATION have succeeded the Way Hardware Company at Hartford, Conn. The company's capital stock is \$20,000, and the incorporators are Isaac Bragaw, S. L. Way and Charles L. Way.

O. H. HOLLAND, Sandwich, Mass., advises us that he has disposed of his Stove and Tin business to George S. Wing, who will carry it on at the old stand.

SHEPHERD HARDWARE COMPANY have purchased the business of E. A. Wisdom, which he has conducted for the past six years at Shepherd, Mich. The members of the new firm are C. F. Johnson, formerly with Mr. Wisdom, who will manage the business, and D. G. Willis, traveling representative in Michigan of the Bostwick-Braun Company, Toledo, Ohio. Mr. Willis also holds a half interest in the Lyons Hardware Company, Lyons, Ohio. The new firm took possession on the 1st inst., and

will be pleased to receive catalogues and other printed matter relating to Hardware, Stoves, Paints and Oils, Sporting Goods, Lime, Cement, &c.

HIBBARD, SPENCER, BARTLETT & Co., Chicago, have contracted for the erection of the new Hardware warehouse which was mentioned some months since as in contemplation. The site of this warehouse fronts on North Water street, while the rear abuts on the Chicago River. The warehouse will have both rail and navigation facilities. Railroad tracks now run along North Water street, and a spur will be extended into the building which will enable eight to ten cars to be run in under cover. The dimensions of the building are 120 x 400 feet, and it will consist of four stories and a basement. The walls will be constructed of brick and stone, the interior being of heavy mill construction. It is expected that it will be completed by January 1. The company's large store building at Lake street and Wabash avenue will continue to be occupied, as all the space will be needed for their constantly growing business.

THE partnership heretofore existing under the style of J. F. Barber & Co., wholesale dealers in Hardware, Tools, Cutlery, &c., and manufacturers of Tinware, Philipsburg, Pa., was dissolved on the 1st inst. by mutual consent. On the same day a new partnership was formed under the name of J. H. Turnbach Hardware Company, who will continue the business at the old stand.

W. B. COX has bought the Shelf Hardware and Stove and Tinware business of John H. Robson, Ovid, Mich., and is continuing at the old stand.

W. E. WATKINS & BRO. have succeeded W. E. Watkins in the wholesale and retail business in Hardware, Stoves, Tinware, Farm Implements, Sporting Goods, Harness, Wagons, Buggies, Sash, Door, Queensware, &c., Mena, Ark. The stock comprises about \$5500 worth of goods.

W. A. MCCALL & SON have lately engaged in business in Hobart, O. T., handling Shelf and Heavy Hardware, Stoves, Tinware, Agricultural Implements, Sporting Goods, &c. The firm also have a house in Nocona, Texas.

GETTS & GETZ BROS. have succeeded E. M. Getts in the Hardware, Stove, Farm Implements, Sporting Goods and Wagon and Buggy business in Delta, Col.

WM. F. ANDREWS has purchased the Hardware, Stove and Farm Implement business of Armstrong & Rider, Union, Iowa. Mr. Andrews intends to increase the stock thus acquired.

J. K. STAPLES & SON have disposed of their Shelf Hardware, Stove and furniture business in Nelson, Mo., to D. H. Louderback, who expects to double the stock thus purchased.

TARRANT & MCGOWAN, dealers in Hardware, Stoves and Miners' Supplies, Reeds, Mo., have sold out to C. B. Hood, who will continue at the old stand. Messrs. Tarrant and McGowan desire to devote more attention to their Zinc mines in that locality.

BEARDSLEY & SON, Norman, O. T., have been succeeded by Beardsley Hardware Company, who have enlarged the storeroom and added Wagons and Buggies to their former line of Shelf and Heavy Hardware, Stoves, Tinware and Agricultural Implements.

EMMERT & PRICE have purchased the Hardware, Tinware and Farm Implement business formerly conducted by J. H. Kelsey & Son, Benton, Iowa.

KERR & HURSH are successors to H. M. Durrett, Wichita Falls, Texas, dealer in Shelf and Heavy Hardware and Stoves and manufacturer of Saddlery.

THE GLOBE COMPANY, 1321 Walnut street, Philadelphia, contemplate adding to their business a line of Coal, Gas, Gasoline and Oil Cook and Heating Stoves, and solicit from manufacturers catalogues and price lists, together with trade and spot cash discounts.

THE SEITER & CHERRY COMPANY, Keokuk, Iowa, dealers in Furnaces, Ranges, Tinware, &c., report a large increase in their shop trade, while the demand of customers in the store is good.

Behrer & Co.'s Bathroom Fixture Catalogue.

The first of three catalogues to be issued by Behrer & Co., 81 Beekman street, New York, has made its appearance. It is devoted to porcelain lined baths, porcelain baths, showers and bathroom furnishings. The catalogue, consisting of 46 pages, 9½ x 12 inches in size, bound in a drab cover having a design in a two-colored effect, is excellently printed and illustrated. The house presents this to show one of their lines of sanitary specialties and plumbers' supplies. It shows a line of fixtures adapted for equipping the bathroom in modern residences, apartment houses and hotels. The bathtubs are guaranteed, and the statement is made that the bathroom fittings are of heavy pattern and heavily nickel plated. The first 22 pages are devoted to a variety of French and Roman pattern enameled iron bathtubs, with wide and narrow rolled rims of different heights, supplied with a variety of styles of nickel plated supply and waste fittings. Accompanying the illustrations are list prices and detailed information in reference to the goods. Enameled iron receptors for use in connection with shower baths are also displayed, together with the simple shower bath and the combination needle and tubular shower bath, both with curtain. Porcelain lined sitz baths and foot baths are also shown.

Several pages are occupied by solid porcelain bathtubs, of French and Roman pattern, shown with different styles of supply and waste fixtures. The illustrations indicate the styles of decoration that can be furnished when ordered. One page presents a picture of a solid porcelain bathtub, designed for setting in the corner of a room. These tubs can be furnished either right or left handed. Porcelain foot and sitz baths are also shown. Eight pages are devoted to shower baths and shower bath fittings, the variety ranging from the combination needle and shower baths to the nickel plated ring shower and shampoo. The remaining pages of the catalogue contain a variety of soap cups, sponge holders, towel baskets, brush holders, tooth brush racks and holders, tumbler holders, towel racks, looking glasses, cigar rests, match scratchers, and a variety of toilet paper racks and holders. The goods shown in the catalogue are tastefully designed and well adapted to the needs of firms who cater for fine trade. The catalogue is to be followed by two others, one devoted to lavatories and their trimmings, and the other to kitchen sinks and laundry trays.

Kewanee Boiler Catalogue.

The heating contractor who does large as well as small work will find much in the catalogue of the Kewanee Boiler Company, Kewanee, Ill., adapted for his use. The company manufacture steel and cast iron boilers of all kinds for power, steam and water heating, steel tanks for all purposes, boiler stacks, boiler fronts and trimmings, and also handle a complete line of steam and water supplies. A bird's-eye view of their factory at Kewanee, Ill., is accompanied by the statement that it has been completed since the issue of their last catalogue, and is equipped with the best boiler making machinery and all the appliances for handling work expeditiously. The company have nearly doubled their producing capacity, while securing much more room for stock and better shipping facilities. The statement is made that in addition to this catalogue the house issue a catalogue especially adapted for boilers for power use only. A page is devoted to boiler ratings, followed by suggestions as to brick set and portable boilers, chimneys and flues, hard and soft coal, and the care of boilers when burning soft coal.

The first boiler shown is the Haxtun, which is made of steel plate, for both portable and brick setting, for steam and hot water heating, and in a variety of sizes. It is followed by the Defender, a steel plate boiler, which is also made in several sizes for both portable and brick setting. Vertical sectional cuts are used to show the construction of the Defender drop tube boilers. The Great Northern, steel plate, boiler is made for burning

hard and soft coal and wood. It is of the return flue, internal fired type. Six pages are devoted to the Kewanee standard Fire Box Boilers of the horizontal return flue type, steel plate construction. The Kewanee east iron boiler is of the round form, horizontal, sectional type, designed for both hard and soft coal, to present a large fire surface, and for a rapid internal circulation, for maintaining a steady water line. The Superior is a vertical, sectional cast iron boiler of the auxiliary crown sheet type, with an indirect draft. The Tabasco is a small heater designed for heating small buildings, made both as surface burner and magazine feed. It is especially adapted for supplying hot water for hotels, laundries, residences, baptisteries, and wherever a large supply of hot water is needed.

The company also manufacture a variety of sizes of storage tanks for use in connection with heaters for supplying buildings of large size with hot water. They are arranged either for being heated by tank heaters, or by steam in pipe coils inserted inside. These tanks are made in sizes from 66 gallons to 1000 gallons. The last half of the catalogue is devoted to the Standard horizontal tubular boilers. Tables give prices and dimensions, and engravings show the front equipment and steam drums, smoke connections, and grate arrangement, while sectional views give the dimensions for setting them. Another section is devoted to vertical tubular power boilers, feed water heaters and tanks tested to stand high pressures for automatic pneumatic water supply and other purposes. Boiler feed pumps and pumps and receivers, gravel basins, blow-off tanks, and staggered tube radiators, followed by a price-list of lap welded boiler tubes, complete the publication.

The P. & S. S. League.

Interest in the bowling tournament of the Plumbing and Steam Supply League brings a good representation of the trade to the Monarch Alleys, Twenty-sixth street and Sixth avenue, New York, each Monday and Thursday night. Last Monday evening the teams of Ronalds & Johnson Company, New York; Ronalds & Johnson Company, Brooklyn, and Dimock & Fink Company each won and lost a game. On Thursday night the team of E. F. Keating lost two games and joined the Central Foundry Company's team at the foot of the list, while the John Simmons Company team won two games and joined Behrer & Co. at the top. The H. P. Read Lead Works won and lost a game. G. J. Ryder of the Brooklyn team of the Ronalds & Johnson Company has top score with 186 and the John Simmons Company team hold the high team score with 699. Next Monday night, when Secretary Wilson heads the aggregation of salesmen, assisted by James Conran, and President Haff brings the F. N. Du Bois Company team to the front, lively work will be cut out for the Crane Company team.

The National Association of Master Plumbers of Australasia.

The annual convention of the National Association of Master Plumbers of Australasia was held at Sydney, New South Wales, from July 29 to August 2. The meeting was presided over by President J. Minto. Representatives were present from New South Wales, Queensland, South Australia and Victoria. After a speech of welcome by the Mayor the convention took up its work, adopting resolutions for the better protection of the plumbers in buying plumbing material; for the reservation of plumbing from general bids; for examination of plans and specifications by experts under the public health act, and for the protection of subcontractors' interests in the collection of their bills. Sanitary, legislative, apprentice and essay committees were appointed. The delegates were entertained at a banquet, a trip to the sewage farm, another around the harbor, and an outing at Correy's Gardens. At the close of the convention it was decided to hold the next meeting at Adelaide during Easter, 1902.

THE MORGAN VACUUM STEAM HEATING SYSTEM.

Vacuum steam heating—namely, heating by steam below atmospheric pressure—is making rapid strides into popular favor. Briefly stated, it possesses the meritorious qualities of the steam and hot water heating plant, while it eliminates some of their objectionable features. The isometrical plan herewith given, which illustrates the vacuum system developed by Morgan & Co., 40 Dearborn street, Chicago, shows an entirely new departure, said to be thoroughly practicable for use in any kind of a building, requiring no pumps, ejectors or apparatus using power to produce a vacuum. This system is entirely self contained, the dampers being governed by the temperature of the vapor generated within the system itself, and may be arranged at will to run above or be-

D is connected to the return pipe so that the water of condensation will return to the boiler, the loop extending up being for the purpose of keeping water from column F. Tank G incloses a coil which is connected at the top to the main return pipe above the water level in generator A and at the bottom with the return below the water level. The air in tank G, being expanded by heat, forces the water from itself into receptacle H, the weight of which, overbalancing the weight at the other end of the rod, causes the dampers to close. As tank G cools off the atmospheric pressure forces the water from the receptacle back into the tank, which, lightening the receptacle, causes a reverse action and the dampers are opened.

The advantages claimed for the system are, first, the even temperatures of the heating apparatus, great rapidity of circulation and an economy of from 25 to 40 per

Isometrical plan of complete steam plant for steam heating below atmospheric pressure and without the use of air valves. A—Generator. B—Radiators. C—Steam pipes. D—Air pipes. E—Mercury traps. F—Vacuum column. G—Tank for damper regulator. H—Receptacle for liquid from tank G. J—Lever controlling dampers.

The Morgan Vacuum Steam Heating System.

low atmospheric pressure. There are no air valves to be tampered with, such air as may be expelled being delivered in the basement, remote from the living rooms. It is an apparatus that cannot be tampered with, and, once arranged, will run indefinitely, it is claimed, without further attention, other than that required to keep up the fire in the boiler and to remove the ashes.

It differs from the ordinary steam plant only by having the air exhaust from each radiator extended through tubing into the basement, where it is connected to the mercury traps E, which in turn are connected to the main air pipe line D, which terminates at vacuum column F. The air from the entire system is exhausted through the air pipes D, the mercury traps E having just sufficient mercury to seal the inner tube against pressure equal to that of the atmosphere (14.7 pounds), the equivalent of a column of mercury 30 inches high. Owing to the small bore of the tube and the large area of the bulb at the end of the pipe E, the air passes through the mercury in its course to pipe D without any appreciable pressure.

The mercury in the bottle at the base of the mercury column F may be varied at will to increase or decrease the pressure of the entire system. At column F, air pipe

cent. greater than either hot water or low pressure steam plant. The cost of installation, it is pointed out, is slightly more than steam and considerably less than hot water.

\$100 for a Think!

The Monash-Younger Company, 201-207 South Canal street, Chicago, Ill., are sending out a card which should prove attractive to the bright young men in the heating trade. In addition to a picture of their Perfected Duplex Locked Shield Air Valve, it also bears the statement: "\$100 for a Think!" The company say that they want an original idea to advertise this air valve—"something new—something good—something best." They offer \$50 for the best idea, \$30 for the second best, and \$20 for the third best. The contest closes January 1. The contestants may submit poetry or prose, sketch or design. These prizes will make fine New Year's gifts to the fortunate competitors. The card which the concern send out should prove a very good advertisement, as it contains some valuable information in reference to the valve which they wish to more thoroughly advertise.

The Standardization of Extra Heavy Flanges.

Steam pressures varying from 100 to 250 pounds pressure entered into engineering practice about the year 1889. For pressures less than 100 pounds there had long existed confusion regarding standards for flanges of pipe, fittings and valves. A schedule of standard flanges was adopted July 18, 1894, by a committee of the Master Steam and Hot Water Fitters' Association, a committee of the American Society of Mechanical Engineers, and the representatives of the leading valve and fitting manufacturers of the United States. As the use of high steam pressures became more general there came into existence so many different diameters, thicknesses, drilling circles and number of bolts for flanges on fittings, valves and pipe for extra heavy pressures that manufacturers could not safely keep stocks of goods, and mill architects and engineers were greatly delayed at times in making up specifications for contemplated work on account of time taken to find out what the different manufacturers could or would furnish.

Recognizing the need of a standard for extra heavy, J. C. Meloon, mechanical superintendent of the General Fire Extingulsher Company, Providence, R. I., issued an invitation to the leading valve and fitting concerns of the country to meet and consider this subject. In response to this invitation several of the largest concerns sent representatives to a meeting at New York City April 24, 1901. At that meeting a committee was chosen to formulate a standard. This committee consisted of J. C. Meloon, mechanical superintendent, General Fire Extingulsher Company, Providence, R. I.; J. F. O'Brien, secretary, the Pratt & Cady Company, Hartford, Conn.; L. R. Greene, engineer, Walworth Mfg. Company, Boston, Mass.; H. D. Gordon, M.E., Jenkins Bros., New York, N. Y.; F. A. Strong, superintendent, Eaton, Cole & Burnham Company, Bridgeport, Conn.; F. A. Connet, engineer, Builders Iron Foundry, Providence, R. I. Mr. Meloon was made chairman and Mr. O'Brien secretary.

The committee had various sessions, and submitted to the manufacturers interested the following recommendations and schedule for standard at a meeting held in New York City, June 28, 1901:

I.
Multiples of four for drilling.

II.
Drilling should straddle vertical axis.

III.
Bolt centers not to exceed 3 3/8 inches, except on 2 1/2-inch size. Committee at first proposed eight 5/8-inch bolts, but sample elbows and flanges were drilled and bolted together, and it was found that eight 5/8-inch bolts interfered with inserting bolts.

IV.
Distance from center of bolt to edge of the flange should always equal or exceed the diameter of bolt plus 1/8 inch for 9-inch valves and under, and diameter of bolt plus not less than 1/4 inch for sizes larger.

V.

Size of pipe. Inches.	Diameter of flange. Inches.	Thickness of flange. Inches.	Diameter of bolt circle. Inches.	Number of bolts.	Size of bolts. Inches.
2	6 1/2	7/8	5	4	5/8
2 1/2	7 1/2	1	5 7/8	4	3/4
3	8 1/4	1 1/8	6 3/4	8	5/8
3 1/2	9	1 3/16	7 1/4	8	3/4
4	10	1 1/4	7 7/8	8	3/4
4 1/2	10 1/2	1 5/16	8 1/2	8	3/4
5	11	1 3/8	9 1/4	8	3/4
6	12 1/2	1 7/16	10 3/8	12	3/4
7	14	1 1/2	11 7/8	12	7/8
8	15	1 5/8	13	12	7/8
9	16	1 3/4	14	12	7/8
10	17 1/2	1 7/8	15 1/4	16	7/8
12	20	2	17 3/4	16	7/8
14	22 1/2	2 1/8	20	20	7/8
15	23 1/2	2 3/16	21	20	1
16	25	2 1/4	22 1/2	20	1
18	27	2 3/8	24 1/2	24	1
20	29 1/2	2 1/2	26 3/4	24	1 1/8
22	31 1/2	2 5/8	28 3/4	28	1 1/8
24	34	2 3/4	31 1/4	28	1 1/8

VI.

The bolt circle diameters, as above stated, will allow the use of calking recess on pipe flanges, provided such device is specified.

The schedule presented was unanimously adopted by the manufacturers present, and January 1, 1902, was the date set for its adoption.

The following firms have agreed to adopt the standard and put it into effect January 1, 1902:

- The Eaton, Cole & Burnham Company, Bridgeport, Conn.
- Chapman Valve Mfg. Company, Indian Orchard, Mass.
- Walworth Mfg. Company, Boston, Mass.
- Crane Company, Chicago, Ill.
- The Pratt & Cady Company, Hartford, Conn.
- Jenkins Bros., New York City.
- General Fire Extingulsher Company, Providence, R. I.
- Builders Iron Foundry, Providence, R. I.
- Jarecki Mfg. Company, Erie, Pa.
- Crosby Steam Gage & Valve Company, Boston, Mass.
- The Kennedy Valve Mfg. Company, New York City.
- The Ludlow Valve Mfg. Company, Troy, N. Y.
- The Lunkenheimer Company, Cincinnati, Ohio.
- The Michigan Brass & Iron Works, Detroit, Mich.
- The Kelly & Jones Company, New York City.
- Eastford Wire Mfg. Company, Belleville, N. J.
- National Tube Company, Pittsburgh, Pa.
- Coflin Valve Company, Boston, Mass.
- Rensselaer Mfg. Company, Troy, N. Y.
- The Mason Regulator Company, Boston, Mass.
- McNab & Harlin Mfg. Company, New York City.
- The John Davis Company, Chicago, Ill.
- Watson & McDaniel Company, Philadelphia, Pa.
- Ross Valve Company, Troy, N. Y.
- Edward P. Bates, Syracuse, N. Y.

The following firms will furnish to standard if desired by their customers:

- Best Mfg. Company, Pittsburgh, Pa.
- Pittsburgh Valve, Foundry & Construction Company, Pittsburgh, Pa.
- Eddy Valve Company, Waterford, N. Y.

The committee's labors were very much lightened by the hearty co-operation of all the firms with whom they held communication, and the list of firms mentioned, embracing the largest manufacturers of valves and fittings in the East and West, shows the interest taken in the subject. A limited number of the schedules will be printed by the committee and copies may be obtained of the secretary, J. F. O'Brien, P. O. Drawer No. 66, Station A, Hartford, Conn.

The Charles Millar & Son Company.

In a recent issue of the *Observer* of Utica, N. Y., considerable space is devoted to the Charles Millar & Son Company, wholesale dealers in plumbers', steam fitters' and tinner's supplies, at 127-29 Genesee street in that city. This house, in addition to manufacturing many goods, carry what is said to be the largest and most complete stock of plumbers' supplies to be found anywhere in the State outside of New York City. Their trade covers a broad field, including New York State, Northern Pennsylvania, Vermont, Western New Hampshire, Western Massachusetts and Western Connecticut. Recently they have set apart a 20 x 60 foot space in the southern section of their establishment as a showroom for the practical exhibition of their plumbing goods, more particularly bathroom fittings and appurtenances. In this showroom a plumber or his customer may see the handsomest and most modern bathroom equipments and observe their operation. The display includes a solid porcelain bathtub and handsome enameled iron bathtubs, with their different styles of nickel plated supply and waste fixtures. Lavatories of equally elaborate finish and handsome design, with various styles of fixtures, may also be seen. Water closets of the most approved pattern and finished in keeping with the bathtubs are displayed in great variety. In addition such special fixtures for the bathroom are shown as towel racks, sponge holders, soap cups, tumbler, tooth and hair brush holders, finger ring racks and French plate glass mirrors in a variety suitable for equipping a luxurious bathroom. Sinks and wash trays for equipping the laundry, kitchen and pantry, of cast iron, enameled iron and solid porcelain, with copper range boilers, are also shown with their suitable fixtures, leaving little to be desired in selecting the plumbing goods for a residence. In addition

to these goods, the house carry a variety of substantial goods of modern construction of less pretention in appearance and finish, but equally well qualified to maintain in a sanitary condition the building in which they are used.

THE PRESENT STATE OF THE SCIENCE OF HEATING AND VENTILATION.*

BY PROF. H. RIETCHEL.

Secret adviser to the Government, and Professor in the Royal Technical High School of Berlin.

Translated from the German by Charles F. Hauss.

When men meet to advance their profession by a mutual exchange of experiences and views, it is well in the first place to show a picture of the present development of the science, to demonstrate what has been done in the premises and to present the problems yet to be solved.

As in all technical branches, the one we have entered has had no check. We have not only worked energetically, but with result. Hence the field of ventilating and heating science has been greatly increased. The growing demands of the time, the increase of population in cities, the endeavors in the field of sanitation and for the general good, the growing knowledge of the meaning as well as the problems and objects of hygiene, have constantly set for us greater problems, urged us to more restless endeavor, and made us the advancers of our profession.

Whereas in the past only large public buildings were provided with central heating and ventilating apparatus, and the erection of this class of apparatus in private residences was looked upon more as a luxury, to-day central heating and ventilation enter into competition with local heating and ventilating for the better class of residences, flats, and, in fact, for all buildings in which a large number of people are assembled.

The successes of science and the demands we make of life are constantly changing; the needs increase with the forces at our command. Whereas, for instance, our parents pursued their studies with a candle or oil lamp, followed in turn, during our youth, by the kerosene lamp and gas, we find that to-day nothing short of electric light or a mantle gas light (Welsbach) will serve us as a source of light. In the youth of our parents the mail coach served the purpose for traveling, while to-day an express train, averaging 50 miles an hour, seems so slow to us that we are seeking means to double even this speedy mode of travel.

So also in our branch have the demands and knowledge increased. Even 20 years ago there was no really scientific knowledge of the subject of heating and ventilation other than in exceptional cases, but generally guess work or rule of thumb was the order of the day. It was more or less a matter of luck, when one of the larger systems erected was satisfactory.

The branch itself was not held in high esteem, being run as a trade, and naturally treated as such. Those in the branch were, for the most part, practical rather than technical men. In our high schools our branch had no place, while to-day our branch has an equal place with any other science. The engineers graduated there have taken a constantly growing interest in this branch, and, through them, the technical knowledge is spread through the practice. Formerly we received our suggestions from France and England; to-day we take our part in the development, and in some things have even taken the lead.

When Professor Böhm successfully heated and ventilated the Vienna Opera House, 40 years ago, the feat was, and rightfully so, regarded as a masterpiece. To-day we plan hundreds of similar plants, and nobody mentions them, because the results achieved are accepted as a matter of course.

Whereas the fear of failure allowed only the smaller

churches to be supplied with heating apparatus—we believing that a large church, for instance the Cathedral in Cologne, could only be heated in an unsatisfactory manner—we know to-day with a certainty that, with proper attention, satisfactory results can be obtained. The fact that in the heating of the Ulm Cathedral, with a height of ceiling of 126 feet, the difference in temperature between floor and ceiling is only $1\frac{1}{2}$ to $3\frac{1}{2}$ degrees, does not surprise us.

We use for heating a number of approved systems, of which one—that of low pressure steam heating—is to be looked upon as a modern achievement. The ingenious arrangement of this system by the firm Bechem & Post urged their competitors to a finer working out of their own systems, and helped to bring the several styles of heating to their present state of perfection, as well as the bringing in of foreign appliances, such as radiators, boilers, &c.

Heating from a central station—viz., the heating of several separate buildings from one boiler plant—has been done successfully for a number of years, though this has not been accomplished with the favorable results expected in the way of economy. The reason for these failures was not due to the system, but to the lack of knowledge and experience, the problem being in advance of the knowledge on the subject; and the use of electric lighting in connection therewith was wanting, which helped to reduce the cost of heating.

Germany has finally started in on this class of heating. In fact, we have in Dresden the largest work of the kind on the continent. There are heated by this plant, on the left bank of the river Elbe, the large Royal buildings, among them the theaters, museum, palace, court house, Catholic church, &c., that are supplied with light and heat from one central plant. The conditions, which are the worst imaginable, demand in coldest weather 60,192,000 British thermal units of heat per hour, part of which must be carried in the radius as far as 4000 feet.

Whereas in the past we used only low pressures out of consideration for life and limb, we do not hesitate to-day to use a pressure of 90 to 120 pounds. In this Dresden plant such pressures are in use, the mains running in trenches under the busy streets. Some of these trenches are under the water line of the river, which, of course, did not stop the carrying out of the work. There are two mains, each only 6 inches in diameter, at the start, with a pressure of 112 pounds at the boilers and 90 pounds at the extreme end of the main, which must be regarded as a result of correct figuring of the areas. The time required for the steam to travel to the extreme end of the system is 23 seconds, and for the return water (which is carried through a separate system) to be brought back to the central plant requires 23 minutes. There is no question as to the success of this plant, as it has been through its first winter.

The heating engineers have a right to look with pride on this work, especially owing to the many obstacles put in its way. Even in the Legislature of Saxony an engineer opposed it. The successful carrying out of the work must be credited to Minister von Watzdorf and his adviser, Mr. Temper, who was the father of the idea, and who put his whole force into the scheme to carry it to a happy conclusion.

Lately, however, there have been quite a number of these systems erected. Wherever possible, a heating system of this kind should be combined with a light and power plant to reduce as much as possible the operating expenses.

At this point heating with gas is also to be considered. Yet gas heating is not central station heating, but local heating with transport of fuel from a central point. As soon as a perfectly safe apparatus is devised for heating with gas this method of heating will offer serious competition to other methods of heating. In this connection it is well to remark that there is a big field for improvement and an opportunity for inventors and engineers in this industry.

In these days of business and industrial depression it might be well for our large electric companies to consider the feasibility of combining with the business of

* Read at the Third Meeting of the Society of German Heating and Ventilating Trades, August 12, 1901, at Mannheim, Germany.

† By central heating the European engineer means either steam, hot water or warm air furnace heating, that is, heating more than one room from a central point, as distinguished from stove or fireplace heating, which is termed "local heating."

lighting also that of heating whole parts of cities. Those companies that have the capital might work with responsible heating contractors, and I am sure that they would be well paid for their outlay.

I am happy to be able to say that, at the present time, we are able to supply almost any demand made on us, no matter what kind of building is to be heated. Yet, in the matter of ventilation, we are often asked by our authorities to do less than we can do, and less than hygiene demands, consequently leaving much to be desired. Hospitals, when being constructed, are handled with the greatest care in the matter of heating and ventilation; yet the demands of hygiene are not fulfilled.

We must admit that if we were to reduce the number of scholars in our schools to conform with the amount of space necessary, according to accepted rules of hygiene, it would be necessary to greatly increase the number of our schools. If the ventilation of school rooms, by opening the windows during recess, is necessary, and, as is officially ordered by our colleague Schmidt of Dresden, it is evident that the air is being vitiated during the occupation of the rooms, which must surely be injurious to health.

Incidentally, the ventilation of our "swimming buildings," the war ships and passenger steamers, affords a splendid opportunity, and is a matter too much ignored in the past. The steamers of our larger lines are fitted out with every comfort, even luxury; yet there is a lack of ventilation, which on steamers, because of the comparatively small space allotted to each person, is so necessary, especially on those steamers that must pass through the hot zones. The ventilation in connection with the bringing in of cool air is a matter that has received too little attention. In our navy the matter of ventilation should not be left to the constructors of the ships, to whom ventilation is an unknown science, especially as the health of the crew must be better where the hygienic demands are fulfilled.

The fact of our being more sensitive over a small difference in temperature than over a large difference in the purity of the air is the only reason I can offer for our having paid more attention to heating than to ventilation. The need of pure air in our cities is a matter of education. What is not considered as absolutely necessary to life is handled more sparingly, and often, in the building of homes, actual necessities are neglected to further the demands of our modern life.

The question of cooling our rooms is fast asleep. No doubt the great cost of a cooling system alone prevents its consideration. Yet it seems that people richly blessed, who give large sums of money for unnecessary articles, ought to be willing to pay for a pleasant and healthful cooling apparatus for their homes. By the use of well-known simple methods it is possible to keep off much of the intense heat. This matter could be considered with profit by our railroad and steamship authorities.

Though I have shown in the foregoing that, in some ways, the science of heating and ventilation has reached a high state of perfection, I cannot refrain from saying that in others it is far from being what we would wish. Hence we must put our hands on the sore spots without fear. In each undertaking there are two things to be decided: giving a contract and accepting a contract. The giving can be done either without or with competition. Giving contracts without competition need not be discussed here, as it is usually a matter of confidence or trust, and if a contractor, in a case of this kind, erects an apparatus that defaults because he did not perform his full duty, the odium will affect him alone. He needs no sympathy.

The awarding of contracts by competition occurs in practice either through open competition, by bidding on a prepared set of plans and specifications, or by each bidder submitting his own plans and specifications. In the latter case his specification is looked upon as a catalogue and price-list, there being no credit given for the amount of knowledge and brain used in preparing it. Mental work cannot be sold by the lineal yard. If the profession of heating and ventilating is a trade, then the submitting of plans, &c., is admissible; but, in view of the fact that we cover a field of science and an ac-

knowledgeed profession, the submission of plans and specifications without being paid for them is an imposition.

Some city and State governments are having their own engineers prepare plans, which is a practice that should be stopped. This not only checks the advance of the science, but prevents many improvements; and necessary parts, which conduce to better regulation and control of the system, have to be dropped in order to make the work as cheap as possible.

In open competition, where, say, five bidders compete, the owner or architect has the benefit of the best thought of five sets of brains, as each man has ideas of his own. If the successful bidder on work prepared by a city engineer be an experienced engineer there is some hope for the work; but if a new and inexperienced firm gets the work it is always far from being a success.

The members of this society have only themselves to blame for the present state of affairs, and I suggest that, in future, you insist that plans be paid for, and that open competition be allowed in the matter of design. In no other competitions should an earnest engineer take part—and no municipal or State engineer should lend himself to it. This is for the general good—I have no personal interest in it.

Another thing I find wrong is the asking for bids for heating without specifying whether it be steam or water, with the result of firms offering the different systems attacking each other fiercely and without good reason. We ought to congratulate ourselves on having two such good systems.

It is only on very large work that this general competition should be recommended to bring out what is best. Otherwise, there should be a fixed programme. Then to decide which is the best system, and which the cheapest, would be the work of the municipal engineer, who can be a welcome link between theory and practice, and, I add, he will be the bridge, provided he doesn't block it with his own ideas. He can do the work so often attempted by the architect, who, because of his many other duties, is so unfitted to perform it.

Then there is the work of testing the apparatus, and making records, and thus advancing our profession. Our colleague Krell once said "There are too few measurements taken," and, I add, it is a fact that the municipal engineers ought to do more measuring and publish these results for the general good.

The default of many systems is not to be charged to improper attention, which fact was demonstrated during the past severe winter. In judging mistakes it is well to consider whether it is an ordinary or extraordinary one. Extraordinary mistakes are not to be prevented at times and should be excused, for it is the engineer who has the courage to experiment that is liable to err. Hence we can ask that he be judged leniently. But for the ordinary mistake it is different. Here the guilty party—except in rare cases—makes his default owing to the influence of insane competition. False economy at the start invariably makes the work more expensive in operation and repairs. The real economy is brought about by thorough figuring, and when Mr. Krell says "We do too little measuring," I will add, "and too little figuring." Some engineers are striving to reduce this brain work, but only figuring will afford a guarantee for the effect of an apparatus and the economy of its operation. This attempt to reduce the amount of figuring is also apparent in the latest literature. I have always held for simple methods of figuring, but only when simplicity is reached without expense to safety. The excuse for not figuring thoroughly is the lack of time; this excuse cannot be accepted.

An architect that cares for his art will figure everything repeatedly, and why should not our profession do the same? The authorities should not award any work until the figures of the contractor have been thoroughly looked over by the engineer.

One fault that helps to increase the number of defaulting jobs is with the public that use them. It is really touching to see them freezing in their rooms, and speaking about cold drafts, but never thinking of refusing to accept the apparatus, because they believe it

must be so. If the room is not properly warmed the layman says: "It is hard to heat." The expert says: "The job is no good."

I only wish, and I proclaim it to all the world, that the public would become more hard hearted, that every apparatus that is not a perfect success should be shown up, the defects publicly proclaimed, and that they be told that such failures are unnecessary. In cases of this kind, to remain quiet is damaging to our profession.

For the newly organized contracting branch of the society I have the fullest sympathy, as I take it for granted that their object is to advance the mutual interests of all connected with the profession. If this society strikes the right road, and holds it, success, I am sure, will not be wanting. May the society strive in the direction that the profession of heating and ventilation will not be followed merely to earn bread, but also to work for the health of our people, so that our profession will present to us great, earnest problems for keeping and advancing the general good of the nation.

New York City Notes.

Trade still continues brisk, with nearly everybody busy. Good journeymen are in demand and helpers very scarce. Many jobbing and overhauling plumbers are complaining that they are unable to make collections promptly.

* * *

The Brooklyn journeymen have attempted to solve the apprentice question by prohibiting the employment of helpers for five years from October 1. Whether this will solve the problem of too many in the trade or not remains to be seen.

* * *

The plumbing trade has lost a staunch friend in the death of Sylvester Murphy, one of the superintendents in the Building Department for Manhattan and the Bronx.

* * *

Alexander Law is busy with a seven-story apartment house at Hamilton place and 141st street. B. P. Eldridge is doing the plumbing in the Caledonian Insurance Company's 12-story building at 50 and 52 Pine street, the residence of J. S. Barnes on Seventy-ninth street between Fifth and Madison avenues, and the Earle Hall at Columbia College. Reynolds & McMahon have just started work in an eight-story apartment at Ninetieth street and Park avenue.

* * *

Probably the finest private stable in the city will be that of W. B. Leeds, on Eighty-eighth street, near Park avenue, where the plumbing is being done under the supervision of Geo. F. McQuillen of the Wells & Newton Company.

The Market for Plumbing Materials.

The scarcity of plumbing materials, while not entirely past, may be said to have been somewhat alleviated. It has come to light since the settlement of the steel strike that there is more iron pipe available than at one time was considered to be within reach. The season has now advanced to a point where many of the rush demands have been satisfied and some time can be allowed to furnish the material still wanted. Sanitary, earthen ware and enameled iron goods are still more delayed in shipment than is agreeable to contractors, and other lines continue in sufficiently urgent demand to make some waiting necessary in the completion of large work. The outlook seems to favor the expectation of a good trade for the balance of the year. This condition is not confined to any one locality. Advices from west of the Mississippi, the Central States and the East all reflect about the same condition.

MULVEY & Fox, Trenton, N. J., have the contract for heating St. Patrick's Roman Catholic Church, rectory and school in that city, at their bid of \$2435.

Enlarged Bathtub Plant.

The Day Metallic Mfg. Company have completed the extension and enlargement of their works at 210-212 Sixth street and Jones avenue, Detroit, Mich. It is now in operation to the full extent of its capacity, manufacturing Day's steel enameled and Day's steel clad bathtubs. The enlarged plant has more than double the capacity it had before the change. The present works of the company occupies a four-story brick and stone building, having a front of 40 feet on Sixth street, and a depth on Jones avenue of 185 feet. Additional machinery and other appliances needed in the various departments of the works have been added, as well as an increased office and showroom. The company report an excellent business both at the Detroit plant and the New York City branch. One of the late circulars of the company is devoted to Day's folding bathtubs, made in three different styles and equipped with a suitable water heater adapted for burning gasoline, artificial or natural gas, or kerosene oil.

Heating and Plumbing Notes.

G. B. MOORE & Co., Springfield, Mass., have recently completed an extensive job of plumbing in the Springfield City Hospital.

THE EATON, COLE & BURNHAM COMPANY, Bridgeport, Conn., have recently secured a plot of about 10 acres at the west end of the city, with a view to enlarging their works. The company contemplate greatly enlarging their facilities. They will gradually add new buildings, until the old plant is dismantled and the entire industry moved to the new location. The plans in consideration contemplate that some five years will be needed for the change. The buildings to be erected in the near future are an iron foundry, 150 x 300 feet, and a tapping and fitting building, 50 x 150 feet. There will also be a fire proof pattern safe 150 feet in length and of suitable width. The buildings will be of brick construction.

THE Board of Education of Niagara Falls, N. Y., have awarded the contract for plumbing and wiring the new High School building to Oliver & Co. of that place, at their bid of \$7780. The heating contract was secured by the Fuller & Warren Heating Company of Boston, Mass., at their bid of \$8344.

FRED. FINN and Fred. Johnson have been appointed as the practical members of the Board of Plumbing Examiners by the Board of Health of Bay City, Mich. They will pass upon the competency of plumbers for plumbers' licenses.

J. H. EDWARDS, 59 Park place, New York, who represents the Aermotor Pumping and Power Wind Mills and manufacturers of Wood and Galvanized Steel Tanks, Pumps, Wrought Iron Pipe and Steel Structural Work, has just returned from a Western trip, in the course of which he spent some time at the factories. He reports finding a very large demand for his various lines of goods. The factories have been considerably behind all summer and are still behind, owing to the steel strike, but are now catching up with their orders slowly, as material is coming in more freely.

JOHN H. STEVENS died at his residence, at Cambridge, Mass., on October 2. He is a well-known plumber, having been in the business for a number of years at 694 Massachusetts avenue, in association with Charles D. Cade.

THE Borough of Wallingford, Conn., has let to the McCormack Steam Heating Company of that place the contract to lay 900 feet of 12-inch sewer pipe.

HUNGERFORD & GRANT, Clayton, N. Y., have been awarded a contract for plumbing on Hickory Island, which is just off the international boundary line, necessitating the temporary location of a Canadian customs officer at the island until all the materials are landed. Those employed are required to live there while at work.

THE NEW BRITAIN STEAM HEATING COMPANY, New Britain, Conn., are placing a hot water heating system in the residence of Richard Murray, at Berlin, Conn.

THE NATIONAL STEAM ECONOMIZER COMPANY of Springfield, Mass., are installing a heating system in the new St. James' Church, at Brightwood, Mass.

"THE POOR BRITISH MANUFACTURER," according to a writer in the *Australasian Hardware*, "is always being nagged at, like the henpecked husband. 'He is so slow;' 'he will lose his trade if he does not wake up;' 'his ideas are antiquated,' &c. Yet he survives it all, living to a venerable old age and leaving behind him when he dies a good name and a good deal of property." With this fact staring him in the face, the writer supposes it is of little use to supply the following growl: "In Sydney, New South Wales, and its suburbs, the American Porcelain Enameled Iron Bathtub is fast ousting the British, for the following reasons: 1. It is cheaper; 2. The shape is likod better; 3. The quality is A 1 and the finish is superior. It may not be quite such a serviceable article as the English production; nevertheless the people will have the American design, and it only, and the British manufacturer gets none of the trade."

A FIRE recently visited the plumbing establishment of Schreiber & Reinhardt, at Lebanon, Pa. The loss was partly covered by insurance.

THE contract for putting in new Incandescent Lights in the building of the Phelps Publishing Company has been awarded to P. C. Fltzpatrick, Springfield, Mass., who is also placing 40 Lights in the mill of the Orchard Company.

THE BOSTON ROLLING MILLS, owned by the National Tube Company, McKeesport, Pa., started up last week, the men returning to work as individuals. No scale will be signed for this plant, but Amalgamated wage rate will be paid. With the resumption of operations at this works all of the manufacturing plants in the McKeesport district are in operation.

LEON M. LOEB, general manager of the Standard Sanitary Mfg. Company for the United Kingdom, arrived in Pittsburgh last week for the purpose of making an inspection of the plants of his concern located in that city and vicinity. Mr. Loeb states that the demand in England for Sanitary Goods made in Pittsburgh is steadily growing, and will continue to expand.

PUBLIC Building Commissioner George H. Elder of West Newton, Mass., will receive bids until October 15 for plumbing a new school building at Newton Center, Mass.

QUARTERMASTER S. B. JONES, Governors Island, N. Y., will receive bids until October 24 for a steam heating plant in the quartermasters' storehouse at Governors Island.

A FIRE, doing a slight damage, visited the plumbing establishment of Doohar & Seager, at Niagara Falls, N. Y., last week.

DIRECTOR of Public Safety F. L. Wormser of Scranton, Pa., has been holding examinations of applicants for journeymen plumbers' licenses, consisting of practical work and the designing of plumbing systems on plans of buildings furnished for the purpose.

THE SERRICUT METAL COMPANY of Providence, R. I., have purchased the Phenix Mill, in East Greenwich, from Samuel Williams and will run it as a branch of their establishment, for the manufacture of Copper and Brass Goods.

THE ALEXANDER FURNACE & MFG. COMPANY, Lansing, Mich., report that trade on their Warm Air and Combination Warm Air and Hot Water Furnaces and Acetylene Gas Machines is very good, and that prices are holding better than last year. They also point out that where heating contractors understand combination heating and make a success of it there is an increased demand for the Warm Air and Hot Water Furnaces.

B. J. LAMBERT, city clerk of Merrill, Wis., will receive bids until October 18 for installing a heating plant in the new High School Building at that city.

STEWART A. JELLETT of Francis Bros. & Jellett, Philadelphia and New York, who sustained a considerable shock in a railroad accident near Somerville, N. J., and has been in the hospital there since, is now reported to be making rapid strides toward recovery. This news

will be welcomed by his many friends in the heating trade.

HENRY B. GOMBERS, secretary of the National Association of Master Steam and Hot Water Fitters, has arrived in New York from a trip abroad.

THE Mayor of Lewiston, Maine, will receive bids until October 21 for a heating and ventilating apparatus and plumbing system in the new Lewiston High School building.

E. D. HORNBROOK, Kansas City, Mo., has the contract for ventilating the Emery-Bird-Thayer Dry Goods Company building, which is said to be one of the most extensive ventilating systems that has ever been installed in that city.

THE plumbing shop and stove store of Alonzo A. West at Malden, Mass., was visited by a fire on October 8, involving damage to the extent of \$12,000, which is partly covered by insurance.

NELSON S. THOMPSON, one of the United States inspectors of heating and ventilating apparatus, recently inspected the new heating system in the Custom House at Atlanta, Ga., installed by the Atlanta Steam Heating Company, who derive considerable pleasure from the fact that the plant was pronounced entirely satisfactory.

P. D. RAYMOND of the Chadborn Mfg. Company, Newburgh, N. Y., is at Queens equipping the 23 greenhouses of the Cottage Gardens with his company's system for the control of the heating and ventilating of buildings.

THE student of the heating problem could find many things to interest him at the exhibition of car heating apparatus made at the twentieth annual meeting of the American Street Railway Association, held in the Madison Square Garden, New York, this week. Many different electrical heating apparatus were shown, besides other systems that have long been under practical test in use.

THE CENTRAL IRON & COAL COMPANY, Tuskaloosa, Ala., an allied interest of the Central Foundry Company of 116 Nassau street, New York City, were incorporated in March with a capital of \$750,000. They have acquired large tracts of red and brown ore lands and 4000 acres of coal lands about 20 miles from Tuskaloosa, where work has already been started upon a large modern blast furnace and coke ovens. As soon as these are completed a well equipped foundry will be erected in close proximity to the furnace. A considerable amount of development has already been done on the ore fields, and operations are so far advanced that by the time of the completion of the railroad, which is now in course of construction, to the furnace, 2000 tons of ore per day can be shipped. The Central Foundry Company advise us that it is not their intention to enter the field of competition on pig iron, but simply to produce their own raw material. The officers and directors are: Joseph Lodge, president; George F. Ross, vice-president; Winthrop L. Rogers, secretary and treasurer; John Reid, Chas. Smithers, Chas. B. Alexander and Herbert Taylor.

New Firms and Changes.

HEALY & WEEKES are a new firm in the plumbing business at Watertown, N. Y. Fred. A. Healy, the senior member of the firm, has conducted a plumbing business at the location of the new firm, 14 Franklin street, for the past five years. John M. Weekes is the son of John Weekes of the plumbing supply house of Hunting-Weekes Company. The new firm, in addition to plumbing, will do a gas, steam fitting and tinsmithing business.

THE A. H. CLEARY PLUMBING & HARDWARE COMPANY have been incorporated at St. Louis, Mo., with a capital stock of \$3000, half of which is paid in. M. J. Cleary holds 28 shares, and A. H. Cleary and C. F. Bauer have one share each.

THE KELLY & McALINDIN COMPANY have been incorporated at 74 Smith street, Perth Amboy, N. J., with a capital stock of \$100,000, by Edward M. Kelly, James E. McAlindin, John McAlindin and Julia L. Kelly, to do a plumbing and gas fitting business.

HANLON & MURPHY are a new firm, composed of Mark J. Hanlon and James J. Murphy, who have purchased

from the estate of the late James Ahern the entire plumbing, heating, gas fixture, and electrical business conducted for years at 280 Asylum street, Hartford, Conn. Both men are thoroughly acquainted with the business, Mr. Hanlon having been for 18 years the manager and attending to the details of the work, and having general supervision in carrying out contracts. Mr. Murphy for 15 years was superintendent of the plumbing department. The new firm will also do electrical construction work and will carry a fine line of Gas and Electrical Fixtures.

THE FLYNN & EMRICH COMPANY have been incorporated at Baltimore, Md., with a capital of \$80,000, by James Flynn, James E. Flynn, William A. Riordan, Sophia M. Emrich and Kate A. Flynn, to deal in all kinds of Machinery and Steam and Hot Water Heating Apparatus.

THE PARIS STEAM HEATING COMPANY of Paris, Texas, have been incorporated, with a capital of \$10,000, by John A. Porter, F. N. Stormont and William F. Little.

WILLIAM F. McCABE and James McCabe are a new firm in the plumbing business at Ware, Mass.

THE GARTH COMPANY, manufacturers of Plumbers' Supplies, are a newly incorporated concern in Montreal, Canada.

R. F. STEWART, formerly of Beaver and Allegheny, Pa., has opened a plumbing shop in the Coleman store on East Pike street, Canonsburg, Pa., under the name of the Canonsburg Plumbing Company.

LECTURES ON STEAM ENGINEERING AND ELECTRICAL WORK.

For the past few years a course of lectures to journeymen steam and electrical engineers have been given at the New York Trade School, First avenue and Sixty-seventh street, New York City. The interest in the lectures has proved sufficient to attract quite a number of attendants. A course of ten lectures in each of these lines has been prepared by Arthur A. Hamerschlag for the coming season, and a ticket for the full course will cost but \$1. It is the aim of the management of the Trade School to make a greater success of this branch of their work this year. The lectures aim to provide information that will be of value to the practical engineer.

It is pointed out that the care and management of engines, boilers and fires, in order to obtain economically the greatest efficiency, is the most important consideration in the operation of power plants. Modern methods in the care of power plants will be discussed and the construction of the apparatus explained. The lectures will be practical rather than technical in treatment, and at the conclusion questions bearing on the subject will be received and discussed. The lectures in this course will be given every other Wednesday night until March 5, beginning October 23. The subjects for the lectures are as follows:

"The Boiler, Water, Fire and Return Tubular." Construction, purpose and where best adapted.

"The Boiler, Bursting Pressures, Rivet and Tube Strength Tests." Methods of calculating capacity, safety valves, &c.

"Grates and Grate Bars." Fixed, shaking, sectional, advantages and disadvantages, size and capacity.

"Flues, Drafts and Fires." Calculating size of flue, height of chimney, forced draft, methods of firing, &c.

"Boiler Capacity in Horse-Power." Methods of calculating horse-power based on heating surface.

"Quantity of Water and Cubic Feet of Steam per Horse-Power." Boiler efficiency, pumps, injectors, &c.

"Low Pressure, Slow Speed Engines." Construction, pressures, speeds, method of regulating, &c.

"High Pressure, High Speed Steam Engines." Their construction, operation, efficiency.

"Calculating Horse-Power." Piston speed, cylinder diameter and revolutions.

"Governors, Valves, &c." Fly ball, centrifugal and inertia governors, poppet, throttle, slide and telescoping valves.

"Setting Eccentrics."

"Direct Coupled Electric Lighting Units." Service and operating conditions, methods of lubricating, reversing, indicator cards.

"Practical Demonstration in Engine Room."

The lectures for journeymen electrical workers will be given on every other Friday night until March 14, beginning November 1. It is pointed out that many electrical lectures are too deeply scientific for the practical workman, whereas these lectures have been arranged with a special view to meeting his needs. They will consist of simple talks, illustrated by experiments and demonstrations, such as will be useful to the electrical journeyman in his every day work, relating to materials, the proper methods of doing work, and the explanation why work is done in a certain way. Questions from those who attend the course will receive consideration at the close of the lectures. The subjects for the lectures are as follows:

"Volts, Amperes, Ohms." A simple demonstration and explanation of the units of pressure, quantity and resistance.

"Alternating and Continuous Currents." Their nature and method of production.

"How to Calculate the Size of Wires." For feeders, mains and branches; also for light and power.

"Dynos or Generators." Construction, principle and capacity; for continuous currents; alternating and pulsating currents.

"Electric Motors." For continuous currents, shunt and series; for alternating currents, induction and rotary field.

"Methods of Testing." Motors, dynamos, arc lights, telephones, electric bells, insulation, resistance, &c.

"Wiring Systems." Three-wire Edison, molding, cleat, insulator, conduit, iron pipe, flexible steel, &c.; junction boxes, bushings, &c.

"Switchboards, Rheostats and Circuit Breakers." Voltmeters, ammeters, &c.; construction of each thoroughly explained; starting boxes for motors, &c.

"Chemical Electricity." Primary and storage batteries; efficiency, operation and construction; principles employed.

"Isolated Plants." Practical demonstration in dynamo room under service conditions.

Aluminum in California.

A deposit of alumina has been discovered in Kern County, Cal., in a ledge from 100 to 600 feet wide, which has been traced nearly 26,500 feet, says *Mining and Metallurgy*. At a depth of 200 feet the ore is still as wide as on the surface. The property is located about 17½ miles west of Mojave, on the Southern Pacific Railroad. The ore is of a decomposed metallic nature, containing iron, magnesia and silica. The assays secured from the ore have run as high as 31 to 35 per cent. alumina. Besides the values in alumina, quartz ledges have assayed from \$2 to \$39 in gold per ton. Samples of the alumina have been sent to the refinery for a test, and a short time will tell whether California can produce aluminum for the markets of the world. This section of Kern County is one of the most ideal places in the world to mine in, as there is plenty of water and timber for mine use and fuel.

S. G. Hobson, the London representative of *The Iron Age* and *The Metal Worker*, is now in this country to confer with exporters of iron, metals, machinery, hardware and metal goods of all kinds as to the best means of developing business. He will visit the leading American cities and will be pleased to supply any information to those interested in the export trade.

At Menzies, West Australia, four camels were recently seen harnessed to the municipal road roller, being employed in leveling a new cycle path. The advantages of the camel for this sort of work are obvious, as it does not cut up the ground as horses do. But then camels are not readily available for use in this country.

The Largest Drawing Press.

Referring to an item in *The Metal Worker* of September 28, regarding a German drawing press recently installed in an enameled ware factory in Canada, which was claimed to be the largest sheet metal drawing press in America, the E. W. Bliss Company, Brooklyn, N. Y., write as follows:

"We wish to state that we have built and shipped to various parts in the United States a number of drawing presses considerably larger than the one to which attention is called. These presses weigh 125,000 pounds and will draw sheet metal articles from the smallest up to pans, sinks, &c., 48 x 28 inches. We have also built machines much larger than these, weighing from 150,000 pounds, but these have been for customers in Europe."

The Bliss Reducing Press.

A new type of double action reducing press has been recently designed and built by the E. W. Bliss Company of 11 Adams street, Brooklyn. It is intended for

The Bliss Reducing Press.

redrawing tin foil bottle caps from the smallest to the largest champagne tops, caster parts, burner shells, and many other articles which have been previously cut and drawn in double action presses, or single action presses in connection with combination dies. By means of an automatic dial feed, operated by a bell crank from the main shaft, the operator can easily place from 50 to 70 first operation shells on the dial plate per minute. As the press is arranged to carry one, two or three reducing punches, from 50 to 210 operations per minute can be performed without loss of time for intermediate handlings. The dial plate is so arranged that the bushings may be easily changed to suit different sizes of shells. To facilitate the rapid action of the press, it is supplied with an automatic knockout for the dies and a positive stripper for the punches. The stroke of the outer slide of the press is $3\frac{3}{4}$ inches; of the inner slide (or plunger), $7\frac{1}{2}$ inches; both of which strokes have an adjustment of $1\frac{1}{2}$ inches. The press will draw in depth

up to 3 inches; there are three openings in the bed, each $4\frac{1}{2}$ inches in diameter, spaced to suit a dial for three operations, as shown in the cut; the width between uprights is $16\frac{1}{2}$ inches; the height over all is 90 inches.

Merchant's Red Book.

Merchant & Company, Incorporated, of Philadelphia, with branches in New York, Brooklyn, Baltimore and Chicago, have just issued what they term their Twentieth Century catalogue, consisting of 138 pages, illustrated by fine half-tone engravings and line drawings, showing the various departments of their works and the large line of goods which they manufacture or handle. The catalogue is of serviceable shape, 6 x 8 inches, bound in a deep red cover and provided with a cord for hanging. In the opening pages illustrations are given of the company's tin plate, smelting and refining works, and of their general and private offices in Philadelphia. Interspersed through the succeeding pages are views illustrating the process of manufacture of tin plates, solder, Babbitt and newspaper metals, also of the Star ventilator department, and the International Sprinkler Company's factory, which is controlled and managed by the concern. Merchant's well known brands of high grade roofing plates, which are manufactured exclusively at their own works, occupy several pages. These include Merchant's Old Method, Merchant's Roofing, American Old Style, Alaska, Camaret, Genuine Worcester, Emelyn and Crescent. Hickory, Empire, Palm, Elsie, Kismet, Stanley and Arch are other grades of roofing plates made by the firm. Attention is also called to Merchant's continuous roofing tin in rolls, and to the large sizedterne sheets made by the firm adapted for car roofing, eave troughs, conductor pipe and cornice work. The company also make a line of high grade bright tin plates and bright tin sheets, which they offer in a number of sizes and gauges. Tables of standard sizes, gauges, sheets and net weights per box of tin plate and taggers tin and black taggers are presented, as well as tables to compute the price of any size of tin plates when basis price per box is given. A number of pages are devoted to solders, Babbitt and anti-friction metals and newspaper metals made by the firm at their smelting works.

Merchant's Spanish tiles, made of sheet metal, are given special prominence. These tiles are furnished with a special interlocking device which is easily adjusted and claimed to be absolutely storm proof. They are made in copper, tin plate, black sheet and galvanized iron. Ridge roof tiles for siding and roofing follow, together with Star ventilators made of galvanized iron, steel, copper or brass in all sizes to meet every demand. These ventilators are made with either conical or flat top, the latter being of glass to admit light. Among other metal goods handled by the house to which attention is called are sheet copper, copper bottoms, seamless brass and copper tubes, brass tubing, brass and bronze in sheets and rolls, brass and copper wire, cold rolled cornice copper, and copper and brass products of all kinds, galvanized and black sheets, Russia and planished sheet iron, Wellsville polished sheets, corrugated roofing and siding, steel roofing in large variety, rock faced brick, sheet zinc, lead pipe and sheet lead, eave trough, gutters, gutter hangers, miters, Perfection cut-offs, cast iron leaders, shoes, and sewer connections, galvanized conductor elbows and shoes, conductor heads, finials and cresting blocks, spiral pipe, and in fact every kind of material used by the roofer and cornice maker are shown by means of cuts in this catalogue. A long line of goods for the use of stove men and plumbers is also included, as well as tinsmith's tools and machines in large variety. Numerous tables of weights, together with a well arranged alphabetical index, combine to make this catalogue a valuable handbook for metal workers, stove dealers, plumbers and others interested in similar lines.

THE DEMMLER WORKS of the American Tin Plate Company, at Demmler, are to be increased from 11 to 24 mills.

FLASHINGS.

THE GEORGE F. WHEELLOCK COMPANY, 107-109 South Tenth street, Birmingham, Ala., inform us that they are doing a good business, having a large number of contracts for Roofing and Galvanized Iron Cornice Work. They report the prospect as very bright.

THE last ten hot mills of the Shenango Tin Plate plant of the American Tin Plate Company, at New Castle, Pa., were placed in operation last week. The other 20 mills of the Shenango plant, as well as the entire Greer works, have been in full operation for some time.

J. K. SMITH of Waterbury, Conn., has the contract for roofing the buildings of the Plume & Atwood Mfg. Company and the Colonial Trust Company in that city.

J. H. FRANTZ, formerly manager of the American Sheet Steel Company's plant at Piqua, Ohio, has been appointed division superintendent for the company, with headquarters at Canal Dover, Ohio. He has been succeeded at Piqua by Charles L. Suessman.

THE GRISWOLD, RICHMOND & GLOCK COMPANY, Meriden, Conn., have the contract for the Galvanized Iron Work in the new school building at Cromwell, Conn.

THE ALAN WOOD COMPANY have broken ground for the new Sheet mill they propose erecting at Ivy Rock, near Conshohocken, Pa.

THE DOWMAN MFG. COMPANY, 20 and 22 Trinity avenue, Atlanta, Ga., are distributing a leaflet calling attention to their Dixie Ventilator, which is manufactured in 36 sizes, from 2 to 60 inches in diameter. These Ventilators, the firm state, are indorsed by prominent architects throughout the South. They are manufactured in the firm's own shops of the best materials. The company are also sending out a circular in the interests of their Galvanized Iron and Zinc Capitals and a Chimney Cap which they claim to have put up in thousands of cases without a single failure. The firm are also manufacturers of Metal Cornices, Skylights, Crestings, Finials, &c., and contract for all kinds of Tin, Slate and Galvanized Iron Work and Metal Ceilings.

FRIEDLEY & VOSHARDT, 194-200 Mather street, Chicago, Ill., manufacturers of Sheet Metal Architectural Ornaments, Statuary, Steel Ceilings, &c., advise us that they have enjoyed an excellent business during the summer months and are looking forward to a large fall and winter trade, all indications pointing to that end.

ONE result of the ending of the strike in the Sheet, Hoop and Tin Plate mills has been that the members of the International Protective Association of Tin Workers have decided to work up Black Plate in the nonunion mills of the American Tin Plate Company. It will be recalled that this class of labor coat the Plates and are not eligible to membership in the Amalgamated Association, but have an organization of their own. The fact that these men will work Black Plates rolled in nonunion mills will probably lead to a complete severance of all relations between the two organizations.

THOMAS SHARPE, Newport, R. I., has the contract for the Metal Work and Tin Roofing for the addition to the Public Library building in that city.

THE HUMBERT WORKS of the American Tin Plate Company, at Connellsville, Pa., a six-mill plant, will be started immediately. The Amalgamated scale will be signed for this mill.

THE AMERICAN SHEET STEEL COMPANY have decided to enlarge their W. Dewees Wood plant at McKeesport, Pa. Ground has been broken for a new annealing department. The three mills dismantled when the company issued the order to remove the plant to Vandergrift will be replaced by new mills. The Wood mill has been in operation for over half a century and has remained in about the same condition for many years past. The improvements now to be undertaken are designed with a view of modernizing the plant and bringing it up to date.

THE national officials of the Amalgamated Association are reported as considering the levying of an assess-

ment for the benefit of strikers who were willing to return to work, but who were turned away. The number of these men is quite large. President Shaffer has made vain efforts to have several blacklisted men reinstated.

THE report that the Youngstown Iron, Sheet & Tube Company of Youngstown, Ohio, had engaged S. V. Huber & Co., mechanical engineers, of Pittsburgh, to draw plans for their open hearth plant is incorrect. While it is true that the Youngstown Iron, Sheet & Tube Company have decided to build a basic open hearth Steel plant, to supply Steel for their Sheet and Tube mills, work on this plant will not be started for some time. However, we can state that the concern will build two Skelp mills, and S. V. Huber & Co. have made plans for these. One will be built immediately, and the other in the near future.

THE MORTON WORKS, at Cambridge, Ohio, and the Banfield Works, at Irondale, Ohio, of the American Tin Plate Company, have been put in operation, the men returning to work as individuals. The Amalgamated scale will not be signed for these two plants.

It is claimed the recent strike in the Hoop, Sheet and Tin Plate mills cost the Amalgamated Association \$82,060 in benefits alone.

It is claimed that the McKeesport Mfg. Company, recently organized at McKeesport, Pa., will build a Sheet mill, to be located somewhere along the Monongahela River, in the Pittsburgh district.

THE LALANCE & GROSJEAN MFG. COMPANY of New York City have begun the erection of a foundry in connection with their mills at Harrisburg, Pa. The foundry will be utilized to make castings for use in the company's mills and their factory at Woodhaven, L. I.

TRADE NOTES.

THE STOVER MFG. COMPANY, Freeport, Ill., advise the trade that the steady growth in popularity and the increased demand for their Ideal and Samson Wind Mills and Ideal Feed Mills compelled them, early in the year, to purchase a new site of large area and to erect a factory there large enough to meet the pressing demands of their trade. A site of 21½ acres in a desirable locality, adjoining the city of Freeport and well situated as to railway communication, was purchased last spring, and the erection of the largest plant ever designed for the manufacture of Wind Mills and Feed Mills has been undertaken, which will increase the output of the Stover Mfg. Company more than threefold. The plant is now being equipped with the most superior machinery, and is furnished with electric power throughout. The company consider that they have now built a large enough factory to meet future demands for years to come.

It is reported from Birmingham, Ala., that a company with a capital stock of \$40,000 are contemplating the establishment in that city of a large plant for the manufacture of Hollow Ware.

GEORGE W. HOFFMAN, 295 East Washington street, Indianapolis, Ind., advises us that owing to the increasing demand for his U. S. Infallible Metal Polish Paste and other specialties he is obliged to increase his capacity by the addition of another building to his present plant.

R. B. MELLON, Arthur V. Davis and other members of the Pittsburgh Reduction Company are reported to be forming a subsidiary company, to be known as the United States Aluminum Company, who will start with a capital of \$25,000. The plant will be located at New Kensington, Pa., where the parent company's Aluminum works is located.

L. & J. A. STEWARD, Tin Can manufacturers of Poultney, Vt., have received a patent on a new lining machine. The machine is used to put a thick liquid on the edge of the Can covers where the seams come when the covers are put onto the Cans. When the covers leave the lining machine they are run through a hot oven on a slowly moving belt. The liquid forms a dried rubber like material when the covers emerge from the oven.

THE LETTER BOX.

Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.

Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.

FURNACE QUESTIONS ON SCHOOL HEATING.

From W. H. J., Cincinnati, Ohio.—Having read the inquiry and studied the plan presented by "J. N." in *The Metal Worker* of September 21, I submit the following for his benefit. My calculations are based on the

Furnace Questions on School Heating.—Fig. 1.—Basement, Showing Location and Arrangement of Apparatus.

supposition that each school room will be occupied by 40 pupils and have provision for an air supply of 15,000 cubic feet per minute. To do this work at least two furnaces will be required, each having a fire pot 34 inches in diameter. A plan of the basement is presented in

Fig. 2.—Plan of First Floor.

Fig. 1, showing the location of the furnace and hot air pipes. It will be seen that a separate chimney for each furnace near the center of the building is designed to be used, and beside them ventilating flues, beyond which are the hot air flues, the idea being to keep the

ventilating flue warm so as to induce a better current in it. One pipe leads from each furnace to a hot air flue, 20 x 24 inches in size, terminating in a register about 7 feet above the floor in each school room. A pipe leads from one furnace to a 16 x 20 inch flue to heat the corridor on the second floor, while a pipe from the other furnace leads to a floor register in the hall. Fig. 2 is a plan of the first floor, showing the arrangement of the

Fig. 3.—Plan of Second Floor.

flues, and Fig. 3 is a plan of the second floor, showing the arrangement of that floor. The cold air duct should have an area equal to that of the hot air pipes, and these pipes should have an area equal to the area of the vertical flues. The sizes have not been given for these pipes as "J. N." may find it desirable to modify the arrangement somewhat and also the sizes. But they should not be reduced, neither should smaller furnaces be used if good heating and ventilation are to be expected.

OIL FUEL BURNERS.

From T. P. B., Taylor, Texas.—I shall be glad to know where I can find the necessary material for installing plants for burning crude petroleum. There is a demand for apparatus of this kind here. I have been considering two methods of my own designing—one using compressed air, and the other expanded air—but prefer to learn of some system which has been practically tested for family purposes in cooking and heating stoves. There is some demand for it in boilers for house heating and for the generation of steam power purposes. Is there some method of spraying the oil in connection with steam, so that it can be burned with a hot flame? I desire to learn where such burners and apparatus can be purchased, and hope the readers of *The Metal Worker* and manufacturers will give me some assistance.

NEW TIN ROOF OVER AN OLD ONE.

From G. C., Dover, N. J.—As the Letter Box of *The Metal Worker* seems to be sought in all cases of disagreement and divided opinion, I offer a little information on the laying of a new tin roof over another. I have sent with my letter two samples of tin—one that was laid on a roof in 1847 and the other in 1880. The circumstances of the case are as follows: In December, 1880, we had a very severe wind and rain storm on a certain Saturday night, and the roof on a hotel building was partly removed as a result. The cornice on the west end of the building gave way, and the wind got under the roof and tore off about half, rolling the chimneys along with it. Perhaps some may think this looks like a fish story, but my assertion can be verified. The reason I am so familiar with the details is because it fell to my lot to superintend the laying of the new tin roof. That portion remaining on was in such a condition

that an entire new roof was considered necessary. The building was 49 x 50 feet, and the tin was laid flat seam and soldered. I advised that the old roof be removed. The owner was one of those thrifty old souls who would "skin a louse for its hide and tallow," as the saying is. He said he would rather take the chances of losing the whole roof than pay for taking off the remaining half. I informed him that it was not good judgment to lay the tin over the old roof, but as he did not consider my advice very valuable I was ordered to get to work and finish the job without any paper between the two metals. The result of this course, nearly 21 years from the time the new roof was put on, is shown in the condition of the tin, which I think rather reflects to the credit of my judgment at the time. As before stated, the original roof was put on in 1847, and the reason I have had an opportunity to observe the condition of the roof at the present time is that the new owner of the building has put one more story on it. This, of course, necessitated the renewal of the roof.

Note.—Our correspondent has favored us with two samples of tin about 6 x 7 inches in size—one marked 1847 and the other marked 1880. On weighing these samples no appreciable difference in weight was discovered. The older tin shows no marks of deterioration from rust on either side, and on scraping shows a good coating. Although it is a terne plate, it evidently has a larger percentage of tin in the coating than the other sample. The paint also has adhered tenaciously to the old plate, and there seem to be no breaks or cracks, the surface of the plate being perfectly covered, although the thickness of the coating seems to be no greater than that of the plate put on in 1880. The plate that was put on in 1880 looks like a plate of one of the better grades. The paint has peeled from the upper side in numerous spots, and while the plate on the whole is well preserved, there is plenty of evidence of rust on both the painted side and the unpainted underneath side. The plate that was put on in 1880 shows that with care in keeping the top side painted the roof might have lasted many years longer. Still it is not by any means in as good condition as the plate that was put on in 1847.

HOW SHOULD RADIATORS BE CONNECTED?

From B. H., New York.—In answer to the request of "I. R.," in *The Metal Worker* of August 10, he has no doubt received so many suggestions and different ways

How Should Radiators Be Connected?

of connecting radiators for the first and second floor that he must be more or less confused. I would advise him to never connect up first and second floor radiators on a straight line of flow pipe, unless he uses the O. S. distributing fitting. With this fitting, however, a straight line can be used with perfect results. It cannot be done with the ordinary fittings unless a break is made in the line. The sketch presented herewith will give him an idea of what I consider the proper way. If the owner is willing to pay for the work the return pipe should be

run as indicated by the solid lines. If, however, he is not particular as to appearance the return may be run straight down, as shown by the dotted lines.

FORMULAS FOR GAUGE OF METAL IN GALVANIZED IRON TANKS.

From W. A. P., Newark, N. J.—Will you kindly inform me where I can procure the formulas which are used for ascertaining the required gauge of metal in galvanized iron tanks to withstand a certain amount of pressure? That is, I want the formulas which are used to tell the thickness of metal required in a tank of a certain diameter, to withstand a specified pressure in pounds per square inch. If there are any books containing these formulas I would be glad to know of them.

Answer.—There are no direct formulas for thickness of iron for tanks. The conditions in regard to pressure are variable with the requirement for wear and the methods of riveting, and also the added strength due to galvanizing on the seams. As a general rule, a factor of safety of six times the strength of the longitudinal seam should be allowed, and for riveted and galvanized seams a factor of safety of four times the strength of the iron should be allowed. Then, as galvanized plate iron is equal to a breaking strain of about 40,000 pounds per square inch, its factor of safety will be 10,000 pounds. For cylindrical tanks to be limited to 100 pounds pressure and 16 inches diameter, we have one-half the diameter

800
for the multiplier of the pressure, or $100 \times 8 = \frac{10,000}{800} = 0.08$ inch, or No. 12 by the American gauge. Hot water tanks of the trade are made somewhat thicker than this for convenience of making connections and for wear. Books on boiler making give the method for computing strains and the bracing for other forms, which should be the same for tanks.

The Merchants' Legislative League.

A branch of the Merchants' Legislative League of New York State has been organized in Rochester, N. Y., and among the merchants identified with the work are the plumbers, stove dealers and hardwaremen of the city. The officers of the State League are: John H. Simmons, president; J. Frank Wiggins, secretary, and George S. Hughes, manager, all of Utica. The principal objects of the league are described as follows:

1. The repeal of that part of Section 1391 of the Code of Civil Procedure which gives a debtor \$250 exemption from levy and sale under execution in excess of what was formerly exempt.
2. The enactment of an adequate garnishment law, to reach the wages of debtors under proper conditions, and to reach moneys, goods, chattels and property in the hands of third parties.
3. The enactment of a law making the wife equally liable with the husband for all household necessities after execution against her husband has been returned unsatisfied, and the wife has property assigned to her by the husband.
4. The enactment of a law reconstructing the lien law, so as to protect material men and laborers.
5. To secure such other legislation as may from time to time seem necessary, and to prevent the passage of laws detrimental to their interests.

The fire record of the United States and Canada for September, according to the *New York Journal of Commerce*, was unusually favorable, showing a total loss of \$7,645,200, against \$8,334,000 in the previous month, and \$9,110,000 in September, 1900. The year, so far, shows about \$16,000,000 less loss than for the same period of 1900, but is about \$21,000,000 worse than 1899.

There arrived last week in San Francisco harbor from Westport, on the Columbia River, near Portland, Ore., a raft containing 7,200,000 feet of lumber, equal to 15 good sized cargoes. The raft was towed by two Puget Sound tugboats and the trip was made without accident. A large force of men was employed for eight months in constructing the raft, which formed a cigar shaped mass 625 feet long, 60 feet broad and 32 feet deep, held together by 70 tons of chains. The timber is estimated to be worth about \$100,000.

TRADE REPORT.

MARKET SUMMARY.

Pig Tin is weak and about $\frac{3}{4}$ c. lower.
Copper remains dull and nominally unchanged.
Pig Lead is very quiet at unchanged prices.
Spelter is more active and about 10c. per 100 lbs. higher.
Antimony is unchanged.
Nickel remains firm and active.
Aluminum is unchanged.
Tin Plates are quiet, with prices still high for spot.
Sheets are a trifle easier both as to delivery and demand.
Old Metals are firm and fairly active.
Sheet Copper is in good demand and firm in price.
Foundry Iron is strong and active.
Hardware continues to move in good volume, with prices generally strong.
Wrought Iron Pipe, in heating sizes, is still scarce and high.
Steel Enameled Bathtubs were marked down 5 per cent.
Plumbers' Brass Work remains firm and in good demand.
Solder has been reduced $\frac{1}{2}$ c. to 1c. per lb., on decline in Pig Tin.
Oilers have been advanced.
Roofing Slate is scarce, with prices firm for all varieties and demand large.
Registers are firm on the advance.
Wire Nails are active, with prices steady.
Cut Nails are unchanged.
Wire continues in good demand; prices rule firm.
White Lead prices are firm and the demand good.
Linseed Oil is scarce and firm.
Spirits Turpentine has advanced $1\frac{1}{4}$ c. per gallon.

METAL MARKET.

New York, October 11, 1901.

Pig Tin.—During the entire week the market for Pig Tin has been weak and declining. Business was very light, as the principal consumers are pretty well covered for the balance of the year. Straits Pig in small lots declining to $25\frac{3}{4}$ c. to 26c. per lb., a decrease of $\frac{3}{4}$ c. from the figures ruling a week ago. The weakness of the market is attributed to free offerings and the pressure to sell from the Straits, where stocks were accumulating during the period of our Steel strike. Charles S. Trench & Co., New York, issued, under date of October 1, the following American statistics on Pig Tin:

	Tons.
Estimated stock on spot, New York, Philadelphia and Boston, September 1.....	1,438
Actual arrivals during September.....	2,640
Total.....	4,078
Estimated consumption during September.....	2,400
Estimated stock on spot, New York, Philadelphia and Boston, October 1.....	1,678
Actual afloat from East Indies, shipments to October 1....	2,188
Actual afloat from England, shipments to October 1.....	975
Actual afloat from Holland, shipments to October 1.....	50
Total visible supply, October 1.....	4,891
As against September 1.....	4,476
As against August 1.....	3,478
As against July 1.....	4,068
As against June 1.....	5,427

Copper.—Consumers still show hesitation in purchasing for forward delivery. Buying is going on entirely on a hand to mouth basis. As Lake Copper is mostly procured from the larger producers, consumers needing prompt delivery are obliged to pay the price asked. Consequently, the market for spot Copper may be described as firm, small lots of Lake Ingot being quoted at $17\frac{1}{4}$ c. to $17\frac{1}{2}$ c. per lb., and Casting Copper at $16\frac{3}{4}$ c. to 17c. per lb. Exports this month have started on a rather small

scale, amounting so far to less than 1500 tons, while the imports during the same period aggregated 700 tons.

Sheet Copper.—The demand for Sheet Copper keeps up in a satisfactory volume, and prices continue to be firmly held on the basis of 21c. per lb. for moderate sized lots from store.

Pig Lead.—This article is very quiet at unchanged prices, American Pig in small lots being quoted at $4.62\frac{1}{2}$ c. to $4\frac{3}{4}$ c. per lb. There is still considerable talk about the great producing interests having large stocks on hand. Rumors of an immense combination of Lead interests are also rife. St. Louis advances report a good demand for Pig Lead in that market, at prices ruling the same as a week ago.

Spelter.—This metal has again advanced, owing, it is said, to a rumor circulated in the West which purports that the United States Steel Corporation have taken option in the principal producing plants. It is even said that the options expire on the fifteenth of this month, and that there is a possibility of their being extended in case the plants should not be transferred before that time. The accuracy of this report, however, is greatly questioned by the prominent men in the trade here, who say that the real cause of the advance is Western manipulation. This is explained by the statement that certain large interests in the West had a considerable amount of the metal turned back on them during the Steel strike, and that they are now endeavoring to bring the figure up to a good point so that they can come out easily. It is not believed that the Steel Corporation have any desire to control any of the Spelter plants other than the Edgar Works, which they now own in fee. The market closed very strong. Good Western brands in small lots are quoted at 4.55c. to 4.60c. per lb. St. Louis advances are that the price of Spelter has again advanced in that market on heavy transactions.

Sheet Zinc.—No change has taken place in the position of this article. Jobbers are quoting 600-lb. cask lots at $6\frac{3}{4}$ c. per lb., and smaller quantities at 7c.

Antimony.—Is unchanged, Hallett's being quoted in small lots at $8\frac{1}{2}$ c. to $9\frac{1}{4}$ c. per lb., and Cookson's at $10\frac{1}{2}$ c. to 11c.

Nickel.—No change has taken place in this metal. Prices are firm, small lots being quoted at 60c. to 65c. per lb.

Aluminum.—An active demand continues. Prices are unchanged. No. 1 Ingot, guaranteed 99 per cent. pure, is quoted in small lots at 37c. per lb. and in 100-lb. lots at 35c.

Tin Plates.—The general condition of the market for Tin Plates remains substantially the same as that prevailing for the past few weeks. The demand for prompt delivery is confined to comparatively small lots, as Plates are still scarce and prices rule high, consequently consumers, except such as are forced to purchase Plates for immediate use, are holding off until prices reach a more reasonable level. Spot Coke Plates still command a premium of anywhere from \$1 to \$2 a box above the official prices of the American Tin Plate Company. So far the starting of the Tin Plate mills does not appear to have affected this market to any appreciable extent. Coke Tins are still scarce to the point of famine, jobbers' stocks being practically cleaned out. It will not be long, however, before Plates will be coming into the market again and consumers, wherever possible, are putting off purchasing until the supply is better. A fair business in futures is said to have been placed, and the market, as a whole, is still very firm. While retail quotations are entirely nominal, it may be noted that Coke Tins are now being quoted by jobbers at 20c. to 25c. a box below the high prices ruling for some time past; that is to say, American Coke Plates, I C, 14 x 20, can be obtained in small lots at New York or corresponding

points at about \$6.75 to \$6.90 per box. Prices of Welsh Plates have again declined during the past week.

Sheets.—Although deliveries of Sheets are reported to be somewhat better since the American Sheet Steel Company's mills were started in full operation, they are still hard to obtain for shipment any time within 60 to 90 days. Jobbers' prices on Black Sheets are perhaps a shade easier in the Eastern market, but they are still scarce and almost impossible to obtain in any quantity for immediate delivery. No. 27 One Pass Cold Rolled Soft Steel Sheets are now quoted at about 4.15c., and Galvanized Sheets at 65 per cent. off the list. Some of the outside mills are said to have entered a large tonnage in Sheets for shipment through the first half of 1902. The prices paid by the buyers are to be the same as those in force at the time of delivery by the leading Sheet interest. The demand for Sheets is good, although not quite so urgent as it has been. It was reported this week that two shipments of German Sheet Iron, amounting to an aggregate of about 2000 tons, are about to be made from Hamburg to this country. The Westinghouse interests are understood to be the purchasers.

Chicago advices are as follows: Quite a heavy demand is felt by manufacturers and some orders are being taken by independent mills, but these are not now in a position to promise even reasonably early shipments. Jobbers are having a continued pressure for shipment from local stocks, especially on Black Sheets. The mills recently on strike are making a little better delivery, but the supply of Black Sheets is still far below the requirements of the trade, and it is necessary to pay a premium for such sizes as may be found in stock. The supply of Galvanized Sheets is somewhat better than that of Black Sheets, but assortments are still badly broken. Prices are continued at 4c. to 4.10c. for No. 27 Black Sheets, but 65 off is the ruling rate for Galvanized.

Old Metals.—Scrap Iron is strong and fairly active. Old Metals of other descriptions are referred to as quiet, although prices are well maintained. Dealers are paying about the following prices for moderate sized lots, delivered at New York or corresponding points:

Heavy Copper.....	per lb.	14¾c.
Light and Tinned Copper.....	per lb.	12¾c.
Heavy Brass.....	per lb.	9¾c.
Light Brass.....	per lb.	7½c.
Lead.....	per lb.	4 c.
Tea Lead.....	per lb.	3½c.
Zinc.....	per lb.	2¾c.
No. 1 Pewter.....	per lb.	17½c.
No. 2 Pewter.....	per lb.	8½c.
Tin Plate Scrap, per gross ton.....		\$6.50 to \$7.00
Wrought Iron Scrap, per gross ton.....		10.50 to 11.00
Heavy Cast Scrap, per gross ton.....		10.25 to 10.50
Stove Plate Scrap, per gross ton.....		7.25 to 7.50
Burnt Iron, per gross ton.....		5.00 to 5.50

THE PIG IRON MARKET.

NEW YORK.—Some large inquiries are in the market, but so far as we can learn no important contracts have been closed. There has been the usual rush of shipments from the furnaces and those consumers who stock up for the winter before the close of navigation. This, it is claimed, accounts at least partly for the falling off in the stock of Eastern furnace companies. We quote: Lehigh, Schuylkill and Virginia Irons, No. 1, \$16 to \$17.50; No. 2 X, \$14.75 to \$15.75; No. 2 Plain, \$14 to \$14.50; Tennessee and Alabama brands, No. 1 Foundry, \$15 to \$15.50; No. 2 Foundry, \$14.75 to \$15; No. 1 Soft, \$14.75 to \$15; No. 2 Soft, \$14.50 to \$14.75; No. 3 Foundry, \$13.75 to \$14; No. 4 Foundry, \$13.50 to \$13.75.

CHICAGO.—The strong buying movement which set in about two weeks since is running at full tide. Large consumers are freely purchasing for delivery running far into next year. Numerous contracts have been made in the past week. This is the season when jobbing foundrymen are making contracts with their customers for the winter, or the first six months of next year, and they are covering their contracts by purchases of Iron. Northern and Southern Foundry Irons are more nearly on an equity. We quote as follows:

Lake Superior Charcoal.....	\$17.00 to \$18.00
Local Coke Foundry, No. 1.....	15.00 to 16.00
Local Coke Foundry, No. 2.....	14.50 to 15.00
Local Coke Foundry, No. 3.....	14.00 to 14.50
Local Scotch, No. 1.....	15.25 to 16.00
Ohio Strong Softeners, No. 1.....	16.00 to 16.50
Southern Silvery, according to Silcon.....	15.40 to 15.65
Southern Coke, No. 1.....	15.15 to 15.40

Southern Coke, No. 2.....	14.40 to 14.65
Southern Coke, No. 3.....	13.90 to 14.15
Southern Coke, No. 1 Soft.....	15.15 to 15.40
Southern Coke, No. 2 Soft.....	14.40 to 14.65

PHILADELPHIA.—Pig Iron is about as firm and as steady as any article on the list. Sales are moderately large, but they are nearly all for this year's delivery; beyond that the demand is hesitating. For 1901 prices are strong and probably a shade higher. Foundry grades are the strongest article on the list. Prices average a little higher than last week. The general market may be quoted about as follows for city and nearby deliveries, and from 25c. to 50c. less at points within a radius of 100 miles south or west: No. 1 X Foundry, \$15.50 to \$16; No. 2 X Foundry, \$15 to \$15.50; No. 2 Plain, \$14.75 to \$14.90.

PITTSBURGH.—The Pig Iron market continues very firm. The United States Steel Corporation have made further purchases of Bessemer for November shipment. Standard Bessemer for the balance of the year delivery is strong, at \$16, Pittsburgh. Heavy purchases of Foundry Iron have greatly strengthened the market, and prices are higher. We quote Standard Bessemer Iron in small lots at \$15.85 to \$15.90; No. 1 Foundry at \$14.75 to \$15; No. 2 Foundry, \$14.25 to \$14.50, and No. 3 Foundry, \$14 to \$14.25.

CINCINNATI.—The buying movement which has been in progress for the past three weeks shows no signs of quitting. Malls are well freighted with inquiries and the business in sight points to good, steady trading for the next week at least. Most furnace interests are now fully sold up for this year on all grades. The bulk of the present buying is for the first half of next year. A very remarkable feature of the situation is the conservative stand taken by the sellers in regard to prices. Usually prices advance rapidly in the face of such a buying movement as the present one, but now there seems to be a disposition to advance slowly. A few Southern furnaces have advanced prices 25c., but are in consequence selling no Iron. A few outside interests are said to be giving away their differential of 25c. in freight rate. The market is, nevertheless, on the basis of \$11, Birmingham, for No. 2, and strong and steady at that. An advance to possibly \$11.50 would not surprise the trade, and it will likely come soon. We quote, f.o.b. Cincinnati:

Southern Coke, No. 1.....	to \$14.25
Southern Coke, No. 2.....	to 13.75
Southern Coke, No. 3.....	to 13.25
Southern Coke, No. 4.....	to 12.75
Southern Coke, No. 1 Soft.....	to 14.25
Southern Coke, No. 2 Soft.....	to 13.75
Southern Coke, Gray Forge.....	to 12.75
Southern Coke, Mottled.....	to 12.75
Ohio Silvery, No. 1.....	\$14.60 to 15.00
Ohio Silvery, No. 2.....	14.10 to 14.60
Lake Superior Coke, No. 1.....	15.10 to 15.35
Lake Superior Coke, No. 2.....	14.60 to 15.10
Lake Superior Coke, No. 3.....	14.10 to 14.60

ST. LOUIS.—The past week in Pig Iron circles has been a very active one, and the influences ruling are considered in every way favorable. A heavy demand continues, and the recent advance in prices does not seem to affect the buying power. We quote as follows for cash, f.o.b. St. Louis:

Southern, No. 1 Foundry.....	\$14.75 to \$15.00
Southern, No. 2 Foundry.....	14.00 to 14.25
Southern, No. 3 Foundry.....	13.50 to 13.75
Southern, No. 4 Foundry.....	13.00 to 13.25
No. 1 Soft.....	14.50 to 14.75
No. 2 Soft.....	14.00 to 14.50

CHICAGO REPORT.

Scrap Iron and Steel.—All kinds of Scrap are moving with no specially heavy demand for any one item. Dealers quote the following buying prices, in carload lots, Chicago delivery:

	Per net ton.
Country Wrought Scrap.....	\$11.00 to \$12.00
Machinery Cast.....	10.50 to 11.00
Malleable Cast.....	10.00 to 11.00
Stove Plate (free from burnt).....	to 8.00
Burnt Iron and Grate Bars.....	5.50 to 6.00
Sheet Iron and Hoops.....	6.00 to 7.00
Plow Steel.....	to 10.00
Breaking Stock.....	9.00 to 10.00
No. 2, such as Shovels, Hoes, &c.....	to 7.00
Old Boilers—whole (Iron).....	6.00 to 7.00
Old Boilers (Iron) cut in single Sheets and Rings.....	9.50 to 10.00
Old Gas Pipe and Boiler Tubes.....	11.00 to 11.50
Cast Borings.....	4.25 to 4.50
Turnings.....	9.50 to 10.00
Horseshoes.....	to 13.00

Old Metals.—The demand is slow. Dealers quote buying prices on small lots as follows:

	Per lb.
Copper Wire and Heavy.....	14½c.
Copper Bottoms.....	13 c.
Copper Clips.....	14 c.
Red Brass.....	13¼c.
Yellow Brass.....	9¼c.
Red Brass Borings.....	11¼c.
Yellow Brass Borings.....	8½c.
Light Brass.....	7½c.
Pipe Lead.....	4 c.
Tea Lead.....	3½c.
Zinc.....	2.80c.
Tin Foil.....	22 c.
Pewter, No. 1.....	19 c.
Pewter, No. 2.....	10 c.

Old Rubber.—Only a moderate demand is reported. Dealers' buying prices are as follows:

	Per net ton.	Per lb.
Garden Hose.....	\$23.00
Air Brake Hose.....	42.00
Rubber Shoes.....	7½c.
Rubber Car Springs.....	4¾c.
Inside Bicycle Tubing.....	21 c.
Outside Tubing.....	7¼c.
Black Rubber.....	4¼c.
White Rubber.....	8½c.

Rags.—Buying price of good country Mixed Rags, Chicago delivery, is 70c. to 80c. per 100 lbs., in any quantities.

Anthracite Coal.—Sales agents report a good trade, with local stocks equal to the demand. The schedule for carload lots is as follows:

	Grate.	Egg and Stove.
Chicago.....	\$5.75	\$6.00
Milwaukee, Wis.....	5.75	6.00
St. Louis.....	6.20	6.45
Kansas City, Mo.....	8.25	8.50

THE HARDWARE TRADE.

There are many indications of the steady movement of business in all parts of the country. The consumption of manufactured products is large, as shown in the excellent trade which the retailers are doing and the activity which prevails in manufacturing establishments. In many lines there is difficulty in obtaining raw material, as the market feels the effect not merely of the steel strike, which caused the stoppage of production for a time, but also in the steady demand made upon the mills by the large business which is doing. Among the Hardware trade the volume of new business coming in to the manufacturers from the merchants is not especially heavy, but is of a character to indicate an excellent state of things in the trade.

In general Shelf Hardware the demand is good, and many manufacturers are unable to supply goods as promptly as called for. In Mechanics' Tools, and in Builders' Hardware the makers are pushed with orders, some of them referring to the existing trade as larger in volume than they have had for years. The amount of building throughout the country is, in fact, one of the indications of the general well being of the people. The character of buildings seems to cover a wide range from large structures in which much iron is used to smaller and less pretentious and less expensive buildings which are going up throughout the country. Prices, as a rule, are quite steady, and in some cases strong. Only a few exceptional lines are regarded as weak. With the satisfactory conditions existing, the excellent crops which have been harvested, the amount of foreign trade which is doing, the trade enters on this last quarter of the year with a promising outlook.

NOTES ON PRICES.

Steel Enameled Bathtubs.—A slight reduction in the price of Sheet Steel Enameled Bathtubs is reported this week. The decrease amounts to 5 per cent. below previous quotations, and is attributed to the efforts of one of the Western manufacturers, who was fortunate enough to secure a shipment of Steel Sheets from the mill, and who made a most strenuous fight for a large portion of the Eastern jobbing trade. The local Tub manufacturers promptly met the new quotation. But little business is said to have been placed at the reduced price. It is considered likely that prices will remain where they now are for some time. The condition of

the market for raw materials for this line of goods does not warrant any other conclusion.

Plumbers' Brass Work.—According to some of the leading manufacturers of Plumbers' Brass Work the present prices on this line of goods are not likely to undergo any changes for some time to come. It seems the manufacturers have been informed that the cost of Copper will remain unchanged until after the first of the year. The demand is steady and the factories are still behind on their old orders. The condition of the market is such as not to warrant any change.

Heating Goods.—The majority of the jobbers of Steam and Hot Water Heating Supplies report a very quiet week. They say that business was not up to their expectations and are at a loss to explain the cause. This should, according to all precedents, be the very busiest part of the season, and dropping off of all rush orders is a surprise to many of the older jobbing houses. The recent decline in the retail price of Wrought Iron Pipe is to some extent accountable for the change, owing to a suspicion on the part of buyers that prices have not yet reached their lowest level. The prices now ruling in this district are not showing a very large profit upon the mill costs, and it will have to be a pretty good sized order that will induce any of the jobbers to shade the present quotations. The supply of Pipe is not at all satisfactory. Some of the heating sizes are still out of the market, and others are held at a slight premium over the ruling quotations.

Registers.—The disposition of most of the manufacturers of Registers is to hold to the higher prices adopted October 1. These prices are said to be adhered to pretty closely in the Eastern market, although some irregularity in quotations may still prevail in some other parts of the country. The claim that prices in the past have been unprofitably low, and the fact that stocks of Registers are by no means heavy, are factors which have tended to the stiffening of the market on these goods. The demand for Registers at the present time is referred to as active and the outlook generally in this department is regarded as satisfactory.

Roofing Slate.—The Roofing Slate market is stronger than it has been for some time past. The demand for Slates this season is unusually heavy, and manufacturers have had difficulty in meeting the requirements of their customers. Vermont Slate, Sea Green, Purple, Variegated and Unfading Green have been in such large demand that stocks of these varieties are greatly depleted. The prices of Sea Green, Variegated and Purple Slates were advanced slightly a month or so ago and quotations on Lehigh Slates were recently withdrawn, owing to the shortness of supply. Manufacturers and dealers state that the heavy consumption of Roofing Slates in the United States this year shows that Slates are growing in favor for roofing purposes. They add that the introduction of Slate roofing in the new sections is constantly being carried on. Stocks of the higher grades of Pennsylvania Slates are fairly large, the demand running mainly to the cheaper qualities, which have become quite scarce. Prices are well maintained and the market for Roofing Slates has a steadier tone than for some time past.

Solder.—Owing to the decline in the prices of Pig Tin manufacturers of Solder have marked down prices from about ½ to 1 cent per pound. Half and Half guaranteed, in small lots, is now quoted at 18 to 18½ cents, and No. 1, 14 to 16½ cents per pound.

Eave Trough and Conductor Pipe.—The trade in these commodities continues good, but there are no special features except a large demand for the goods, the prices of May, 1901, still being maintained without any disposition to shade them on the part of manufacturers.

Oilers.—Several advances have recently been made in Oilers, and the market is in an excellent condition, the advanced prices being quite firmly adhered to. A good many of the jobbers, however, have some goods on hand purchased at former prices, and there is some slight irregularity on this account.

Pumps.—The relations between the manufacturers of Pumps are referred to as much more harmonious than

usual, although there is no formal agreement in regard to prices which includes all of them. Prices, however, are pretty regularly maintained, with an excellent volume of business.

Wire Nails.—Wire Nails are moving in large volume and shipments are being made by mills with considerable promptness. Prices made by outside mills are being generally met, which results in concessions at competitive points. Small lots from store, New York, are quoted at \$2.60 per keg.

Cut Nails.—The demand for Cut Nails continues fair. Prices are said to be somewhat uneven at points where competition is most keen. Small lots from store, New York, are quoted at \$2.18 to \$2.30 per keg.

Wire.—The demand for Plain Wire continues heavy and the mills have not yet caught up with back orders. There is some unevenness in prices of Plain Wire at points of delivery where competition is keen. Plain Wire is sold in a retail way in the New York market at 2.60 cents and Galvanized at 3 cents.

White Lead.—White Lead in Oil continues in good demand. Prices are referred to as being satisfactory. No change has been made in New York quotations, which are 7 to 7½ cents for retail quantities.

Linseed Oil.—The scarcity of Oil is the principal feature in the Linseed Oil market. Crushers have not been able to make prompt deliveries on contracts, but are giving their customers some Oil to keep them going. It is not probable that much relief can be expected during the next week or two. The demand for spot Oil is good and the market firm, City Raw being quoted at 65 to 66 cents per gallon, and Boiled Oil 2 cents per gallon advance on Raw.

Spirits Turpentine.—The slowness with which Turpentine is coming into the Savannah market makes the offering at this point light, and advances in prices have resulted. Higher values have checked business and sales are confined to small lots. Quotations are 38 to 38½ cents per gallon.

A Novel Advertising Dodge.

I recently received, says a correspondent of the *Ironmongers' Chronicle* of London, an ordinary tie-on label sent out by an enterprising American firm. It had a small piece of string attached and I naturally began to wonder what these generous friends had sent, and instantly seized upon pen and paper to write an indignant protest to the "G. P. O." The post office officials had evidently spotted it, too, for on the corner of the address label was written, "came to hand without contents of parcel." When on closer examination I found the following lines upon the back in small but clear type, the plot was revealed and the intention of the sender impressed upon my mind, clear and strong:

"No, there wasn't anything else sent. This is all. But it is not *our* fault. You should know by this time that we would *like* to send you something attached to a tag, by mail, express or freight. Now we have attracted your attention, may we ask you to look over our specimen book, &c. No time like the present, you know."

The London *Ironmonger* reports that in the course of reopening a disused coal mine at Blair Burn, Scotland, some miners' tools and a few wooden shovels, such as were in use 250 years ago, have been discovered. The shovels are all made of wood, some of them being as good as the day they were made. The picks are iron. It is further stated that there are huge blocks of coal lying about, all cut out with the pick, and so large that it puzzles present day colliers to know how the task of cutting them out was accomplished. The pit in question was sunk in 1654 and closed about 1657.

THE new Aluminum plant which the Pittsburgh Reduction Company have just completed on the St. Maurice River in Canada, about half way between Montreal and Quebec, is to be placed in operation at once. The new

plant is designed to supply Canada with Aluminum, and an effort will also be made to secure an export trade with Great Britain. For the present the crude Aluminum will be turned out, but later it is expected that a rolling mill, similar to that in New Kensington, Pa., will be built near the new works. The total cost of the present plant, which has been in course of erection for two years, has been about \$1,000,000. The company have about 10,000 horse-power installed, and will manufacture some 10 tons of Aluminum daily. The product will be shipped by water down the St. Lawrence River.

Straits, in bars.	27 1/2 @ 27 1/2

Tin Plates, American

Charcoal Plates, Bright—

N. B.—The price of 20 x 28 sizes is double the price of 14 x 20.

Calland Grade:	
IC.	14 x 20. \$7.75
IX.	14 x 20. 8.25
IXX.	14 x 20. 10.50
IXXX.	14 x 20. 11.75
IXXXX.	14 x 20. 13.00

Melyn Grade:	
IC.	14 x 20. 7.25
IX.	14 x 20. 8.75
IXX.	14 x 20. 10.00
IXXX.	14 x 20. 11.25
IXXXX.	14 x 20. 12.50

Alway Grade:	
IC.	14 x 20. 6.75
IX.	14 x 20. 7.85
IXX.	14 x 20. 8.95
IXXX.	14 x 20. 10.05
IXXXX.	14 x 20. 11.15

Coke Plates, Bright—

Bessemer Steel, or equal to J. C.	14 x 20. \$6.75 @ 6.90
B. Grade, full weight	
IX.	14 x 20. \$7.25 @ 7.50

N. B.—The reduction per box on lighter plates than IC, 14 x 20, is as follows:

100 lb.	15¢
95 lb.	20¢
90 lb.	25¢
85 lb.	30¢

Terne Plates—

N. B.—The following prices are for IC 20 x 28, the rate for 14 x 20 being half as much. IX is usually held at \$2 per box advance for 8 to 10 lb coating and \$2.50 to \$3 advance for 15 lb and upward.

About 40 lb coating.	\$17.50 @ 18.00
About 80 lb coating.	16.75 @ 17.25
About 20 lb coating.	14.75 @ 15.25
About 15 lb coating.	12.75 @ 13.25
About 8 lb coating.	12.00 @ 12.50

Boiler Plates, American—

IXX, 14 x 26. (112 sheets)	\$14.00
IXX, 14 x 28. (112 sheets)	17.00
IXX, 14 x 31. (112 sheets)	18.50

Troughs, Eave—

See Eave Trough.

Trucks, Stove—

Improved Lock Frame, per doz.	\$15.00
Steel Lock Frame, per doz.	18.00
Daisy Improved pattern, per doz.	18.00

Tubes and Tubing—

Brazed Brass, List Feb. 26, 1896.	30¢ @ 35%
Copper and Bronze, 3¢ per lb. list more than B. as.	
Seamless Brass Tubes, net list Feb. 8, 1899.	
Tin.	50%
Galvanized.	50%
Fittings for do.	40%

Zinc—

600 lb casks per lb.	6 1/2¢
Per lb.	7 1/4¢

PLUMBERS' AND STEAM FITTERS' SUPPLIES.

Boilers, Galvanized—

Standard Boilers:	
30 gal.	65¢ @ 70%
35 and 40 gal.	65¢ @ 70%
Other sizes up to 52 gal.	60¢ @ 60 1/2
52 gal. and above.	60¢ @ 60 1/2
Extra Heavy Boilers:	
18 to 52 gal.	50¢ @ 60%
53 gal. and above.	50¢ @ 55%

Brass Work, Plumbers'—

List of December 7, 1896.

Compression:

Sheet Metal Pattern Drafting

A course of instruction by mail for tinsmiths, coppermiths, plumbers, sheet-iron workers, furnace workers, skylight makers and others that will enable a student to "strike out" working patterns for all kinds of sheet metal work. This is what a student says:

His Course More Than Paid for Itself

I am a tinsmith, and consider your course in Sheet Metal Pattern Drafting one of the best investments I ever made. Before I was half through I had realized from it more than the money paid for the whole course.

M. E. TOBIAS,
63 Fifteenth St.,
Wheeling, W. Va.

We teach by mail Mechanical, Steam, Electrical, Civil and Mining Engineering; Shop and Foundry Practice; Mechanical Drawing; Architecture; Plumbing; Sheet Metal Work; Telephony; Telegraphy; Chemistry; Ornamental Design; Lettering; Book-keeping; Stenography; Teaching; English Branches; Locomotive Running; Electrotherapeutics. When writing state subject in which interested.

taught by mail.

TINSMITHS' HELPER *and* PATTERN BOOK

WITH USEFUL RULES, DIAGRAMS and TABLES
= By H. K. VosBurgh =
NEW AND IMPROVED EDITION

A USEFUL hand-book for tinner and other mechanics, treating simple problems in pattern cutting, such as are of daily occurrence in the shop. An elementary manual for the young tinsmiths. A handy reference for all sheet metal workers.

120 Pages
53 Figures

An Invaluable \$1.00
Pocket Companion . .

Section 1 ~ Pages 1-66 Diagrams and Patterns

Demonstrates in a simple way, and by means of illustrations and descriptive text, about 50 examples of sheet metal pattern work, such as the method of cutting can breasts, flared tinware, scale scoops, oval boiler covers, lips for measures, elbow patterns, &c.

Section 2 ~ Pages 69-88 Epitome of Mensuration

Compiled with regard to the requirements of the tinner, describing how to find the area of a circle, the circumference of a circle, the contents of a sphere, a cylinder, a cone, and other information relating to the work of a tinsmith.

Section 3 ~ Pages 89-120 Tables, Rules, Recipes

Gives tables of the weights of sheet metals, including the weight of black sheet iron, sheet lead, and galvanized iron sheets with their dimensions; the weight of lead pipe per foot; the weights of tin plates, sheet copper and sheet zinc. Several pages are devoted to tables giving the areas and circumferences of circles, the capacity of cans, the number of barrels in cisterns and tanks, sizes of tinware in form of frustum of a cone, &c., and practical receipts, including mixtures for solders of different kinds, soldering fluxes, and various cements.

PROVIDENCE, R. I.

A Few Points About The Dover Elbow:

No unsightly seams or corrugations standing out to give it a bunched appearance.

The outside can be polished, as it presents a smooth, even appearance.

The seams are folded on the inside.

No corrugations to reduce diameter and collect soot.

No seams to corrode and rust.

It is made on a scientific principle. It is the same diameter as the pipe.

It is handsome. It is strong. It is the best elbow on the market.

**Corrugated Iron, Steel Roofing, Eave Trough,

**THE REEVES MANUFACTURING CO.,
CANAL DOVER, OHIO.**

A UNIVERSAL REMEDY FOR LEAKY ROOFS.

The valuable qualities of a good roofing cement are firm adhesiveness and elasticity. These qualities the American Seal Builders' and Roofers' Elastic Oil Cement possesses. It will adhere firmly to Slate or Metal and will not crack or crumble. It is especially recommended for repairing leaks around chimneys, dormer windows, skylights, scuttles, firewalls and any place that requires fixing on a roof, either Slate, Tin or Shingle.

This Cement will answer to repair a roof when Solder cannot be used.

PUT UP In Barrels, about 800 lbs. In Tubs, about 112 lbs. In 25 and 50 lb. Pails. In 5, 10 and 15 lb. Pails.

Galvanizing and Tinning.

▲ Practical Treatise on Coating with Tin and Zinc, with a Special Chapter on Tinning Gray Iron Castings. By W. T. Flanders. Size 5½ x 8 inches. 93 pages, 40 illustrations. Cloth bound. Price \$2.00.

The author of this work has made a specialty of galvanizing and tinning, and has been employed to erect plants in various parts of the country, also to instruct the owners, so that, in all instances, they have been able to operate them successfully. The subject of galvanizing is, therefore, treated from the standpoint of an expert and in a practical manner. The selection of materials and apparatus for erecting plants of large and small capacity is treated, together with instructions for their equipment and accompanied by many illustrations of the plants and of the tools and appliances. Plain directions are given for the preparatory treatment of metals and articles to be coated, and every detail which is of importance in successfully applying to metals a secure and attractive coating is described. The tinning of articles is treated in the same practical manner. The difficulties found by many who have attempted to tin malleable and gray iron castings are explained and methods for doing the work made simple.

CONTENTS.

Galvanizing.

Locating a Plant and Selecting a Kettle.
The Galvanizing Room.
Tanks for Acids and Other Purposes.

STAMPING THE PLATES.

Securing the right results in stamping Metal Ceilings is not so easy as a great many people think.

The dies must be accurate and have the proper amount of draw.

The metal sheets must be of the right temper—properly annealed—tough, not brittle; added to which is required time, skill and patience on the part of the pressman to successfully do the work.

Especially is this the case with deep, bold stampings, which must be brought out gradually, by successive operations, and with greatest care.

Failure to comply with these conditions means spoiled material, insufficient stamping and imperfect plates.

A notable feature of Berger's Classic Metal Ceilings is the high order of stamping that they display. You don't have to guess what the design is. It stands out in bold relief.

By devoting careful study and expert attention to the various details, from start to finish, we have succeeded in raising the standard for this class of work; and in producing stampings clear, clean-cut and true to detail, and of depth and boldness once thought to be unattainable.

Compare our regular work with the regular work of others and judge for yourself if we are right.

The New Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting
as applied to all branches
of sheet metal work.

Cloth Bound, Price \$5.

This work contains a collection
of 218 problems and an elaborate
explanation of the principles of
pattern cutting, including Triangu-
lation.

It embodies the problems of the
former Metal Worker Pattern Book,
all of which have been revised, and
many of which have been entirely
rewritten and solved by more ap-
proved methods. To these have
been added 75 new problems and
much other new material and ex-
planatory matter, making this work
a model of completeness in every
respect.

ARRANGEMENT.

In point of arrangement the new
work far surpasses the former one
in that the problems are classified
under three different heads, and
simply indexed, and also that by
means of a table of contents any
required department of the work
can be easily found.

CONTENTS.

While Chapter VI, comprising the
greater part of the work, is devoted
to the solution of problems, the
five preceding chapters thoroughly
explain the principles of pattern
cutting, and place the student in
possession of the preliminary infor-
mation necessary to a thorough
understanding of the subject.

SUMMARY OF CONTENTS.

- I. Terms and Definitions—15 pages.
- II. Drawing Instruments and Materials—13 pages.
- III. Linear Drawing—6 pages.
- IV. Geometrical Problems—35 pages.
- V. PRINCIPLES OF PATTERN CUTTING—25 pages.
- VI. PATTERN PROBLEMS (3 Sections)—325 pages.
 1. MITER CUTTING,
 2. FLARING WORK,
 3. TRIANGULATION.

All Tanners, Cornice Makers and
Sheet Metal Workers should be
provided with a copy of

The New Metal Worker Pattern Book.

THE DOUBLE TRUSS CORNICE BRAKE.

This is the most practical brake on the market.

It is the most practical because, in the first place, it is lower in price than any other Cornice brake that will do perfect work. Secondly, because its practical construction enables you to use it to the most profitable advantage.

When you hear about a good thing in your line of business, investigate it. Turn on it the light of reason and consider its money-making possibilities.

Let us send you information regarding our double edge on front leaf, for making fine members and corrugations.

make the cutting of sheet metal of heavy gauges an easy task for the mechanic and a profitable operation for the employer. With them a man can cut No. 12 steel with one hand on the lever, leaving the other hand free to guide the stock while cutting elbows, ties and circles, as small as 8 in h radius; this is done without burring or buckling either piece, thus avoiding hammering and straightening, which add to the cost of the product. They split sheets of any width or length up to No 12 gauge, cut wire or bar-steel 1/8 inch thick, cut off and mitre angle iron 1/8 inch thick, and do it perfectly.

WARM AIR FURNACE.

FOR SOFT COAL.

All Cast Iron. Strictly High Grade.
Very Durable.

The Hot Air Blast Appliance

Is so formed that the distribution of the hot air to the combustion chamber is equally divided at three points:—at the back and on each side. This appliance embodies the important advantage of a hot air blast and also the very vital point of a durable construction. This question of durability of a hot blast appliance for soft coal fuel is one that has caused much annoyance and expense, and in this construction we have carefully provided for this important point. It is not a part of the combustion dome or fire pot, insuring equal expansion and contraction. The air is discharged into the combustion chamber directly over the surface of the fire and at a very high temperature, yet the construction is such that the combustion does not come in direct contact with it; the parts are allowed to expand and contract equally.

CRAWFORD
RANGES.

Finest Factory in this Line in the World.

When you have a call for a large range you needn't
hesitate a minute about recommending the . . .

Magee Double Oven Kitchener

You can't give it too strong an endorsement. The range itself will bear you out in everything you say. The Double Oven Kitchener has been an immense success from the start—used in Hotels, Boarding Houses, Restaurants and Private Dwellings. Don't know of a single disappointment.

Low Hot Closet Range shown here. Furnished also with High Shelf, High Closet or Plate Rack. Portable form or for Brick Setting. For hard coal or wood. Write for catalogue.

CINCINNATI, O.

Moore's QUICK OVEN **Stoves**

HUSTLES HIM TO WASH HIS FACE

Mr. B. J. Norby of Cassville, Mo., writes as follows:

"One of the Steel Stoves recently ordered was for Editor Charles Ray. He is very much pleased with it. Mrs. Ray thinks that there is no other worth having. She says it bakes so quickly that her husband hardly has time to wash his face before breakfast is ready."

The kind of satisfaction shown in this letter is the kind that counts big for future business. It reaches the neighbors and friends, and in the end makes many sales.

MOORE'S QUICK OVEN STEEL STOVES give this kind of satisfaction in abundance. That's what makes them

"The Easy Line to Sell."

Joliet Stove Works, Joliet, Illinois

HOLBROOK, MERRILL & STETSON, San Francisco, Sacramento, Los Angeles.

1902

"RELIABLE"

STOVES and RANGES

represent the highest type of perfection in stove construction. They are far superior to all others in points of style, finish, durability and economy in the use of fuel.

"RELIABLE" STEEL RANGE BODIES are made of Wood's best blued polished steel, thoroughly lined with sheet asbestos and steel plate. Bottom oven plate is protected with two thicknesses of asbestos and three thicknesses of steel; also a two inch dead air space. This construction insures economy of fuel.

Our removable duplex grate is the best and our sectional fire pot is a proven success.

Our **"RELIABLE" OIL HEATERS** are too well known to necessitate our setting forth their many advantages over others. Suffice it to say they bear the name "RELIABLE."

Twenty-three years of continued success in stove making and the past reputation of the "RELIABLE" is our best guarantee for the future. They have given universal satisfaction to thousands in the past, and will to you.

This Is The Line That Never Disappoints.

Keep your eye open for our **1902** line of **Gas** and **Vapor** cooking and heating appliances. We have some rare surprises in store for you later on.

Model Oak

Entirely New Line for 1901.

We use the old name, but the numbers are different.

The Round Air Tight Register is ground into its seat on the inside of the ash pit door and will remain at any degree of opening required to supply air for combustion through the opening.

The register construction is such that the **Grate Handle** can be pulled out through the register opening.

The Extension on Top of the Fire Pot extends up inside of the steel drum and is cast solid with the fire pot so it cannot twist and warp.

The Sectional Ring fits over the flange turned out on the bottom of the steel drum.

The Ash Pan fits tightly all around the edges of the ash pit.

The joints remain tight.

The price is just right.

SPRAGUE Damper and Valve Regulator.

AN ARGUMENT.

The Sprague Damper Regulator is the most faithful apparatus ever placed on the market for the regulation of heat. Why is it so faithful? Because it is so simple it cannot fail after once being installed and adjusted. It does not depend upon electricity or compressed air. The heat in the room warms the sensitive plate "A," causing expansion. Contraction is also unavoidable the moment the heat recedes. These two agencies alone do the work.

SOLD ON THIRTY DAYS'

TRIAL. Present this proposition to your customers. We offer you the exclusive sale.

PERHAPS you don't know that you can buy the "DIGHTON" Furnace with Casings, Hot Air Pipes, Smoke-Pipe, Collars and Dampers, Elbows, Register-Boxes, Registers and Iron Borders at about the price you have to pay for most other good Furnaces for the castings alone.

If you can guarantee your customer equal or better results than can be secured with other Furnaces, and we stand back of your guarantee, isn't it worth while for you to give the "DIGHTON" some consideration?

A 22 inch fire-pot "DIGHTON" will do more work than most other Furnaces having a 24 inch pot.

A 24 inch pot "DIGHTON" will do more and better work with less fuel than any other 24 inch pot Furnace, no matter what price you may pay for it.

Furnace Heating.

A Practical and Comprehensive Treatise on Warming Buildings with Hot Air, by William G. Snow, with an Appendix on Furnace Fittings. 170 pages; size, 6 x 9 inches. Cloth bound. Price, \$1.50.

This is the only book that has been brought out which presents a systematic and reliable treatment of the warm air furnace system of heating.

It deals with the various types of furnaces, their construction, proper location and setting, together with furnace fittings, and all matters pertaining to the installation of furnaces and to effective and economical heating by warm air. The subject is discussed for the first time by a competent author possessed of a scientific education and a practical training, who presents positive rules, based on a long experience, for guidance in designing furnace systems for dwellings and other buildings where this popular method is employed. The various details of furnace work are described simply and at such length that the volume will be valuable to all who are in any way interested in the subject. It is recommended to practical furnacemen, to architects, builders and house owners, and to tinnerns and plumbers in suburban sections who do furnace work. To all these it will prove a reliable text-book and guide.

PARTIAL SUMMARY OF CONTENTS BY CHAPTERS.

Chapter I.—Furnaces—Is devoted to Furnace Construction—The Relative Proportion of Furnace Parts—Secondary Heating Surface—Economy and Efficiency—Heating Capacity and Exposed Wall Surface—Manufacturers' Ratings of Their Own Productions, etc.

Chapter II.—House Heating—Compares Furnaces and other apparatus, and describes Method of Setting Brick and Portable Furnaces—Location and Area of Cold Air Supply—Cold Air Rooms and Air Filters—Return Ducts and Air Circulation—Size of Hot Air Pipes—Location of Registers, etc.

Chapter III.—The Combination System—Discusses Heating Distant Rooms with Radiators—Balancing the System—Location of Water Heater in Furnace—Capacity of Water Heaters—Size of Radiators, etc.

Chapter IV.—Air—Deals with the Necessity of Ventilation—Water Needed to Moisten Air—Expansion of Air—Velocity of Air in Tubes, etc.

Chapter V.—Heating and Ventilation of Buildings—Considers the Size of Furnaces Required—Fresh Air Room and Supply—Air Circulation—Size of Flues—Use of Stack Heaters—Size of Heating Coils in Vent Flues, etc.

Chapter VI.—Heating of Public Buildings, Churches and Stores—Is given to the Size of Furnaces Required—Grate Surface in Ventilated Buildings—Air Supply—Size of Heating and Ventilating Flues—Size of Stack Heater, etc.

Chapter VII.—Fan-Furnace Combination System—Is devoted to Positive Warm Currents from Fan Systems—Location of Fan and Driving Apparatus—How Good Furnaces are Aided by Fans—Types and Efficiency of Fans—Area of Ducts and Flues, etc.

Chapter VIII.—Temperature Control.

Chapter IX.—Estimate and Contract Blanks.

Chapter X.—Value of Fuels. The Proper Size for Furnace Chimneys—with tables.

APPENDIX.

Furnace Fittings.—A section of 45 pages dealing with the Making of Furnace Casings—Metal Cold Air Boxes—Making Furnace Bonnets and Collars—Making Pipe and Elbows—Register Boxes and Stack Shoes, etc.

Sent postpaid on receipt of price, \$1.50.

A 62-PAGE PAMPHLET

Comprising a Series of
Articles and Letters on
*Chimney Troubles
and Their Remedies*
published under the title

Contains a compilation from the col-
umns of THE METAL WORKER, of arti-
cles and correspondence relating to
house chimneys, defective flues, and
kindred topics, comprising a source of
information of the most practical and
reliable nature, on overcoming difficul-
ties which occur in the working of
chimneys, flues, etc.

To all who are interested in flues
and drafts, in their relation to
stoves, furnaces and house heating ap-
paratus, this book will prove instruc-
tive and helpful.

The Contents are as follows

	Page.
POINTS ON CHIMNEYS	7-32
An illustrated article by J. L. Barry, Jr., describing many details in chimneys, which cause trouble, and giving remedies. An important table is presented, of the sizes of chimneys required in dwelling houses, based upon the amount of work to be done.	
DEFECTIVE FLUES	33-35
This article presents information resulting from a wide, practical experience of the writer, and gives sound advice on some of the details of chimney construction.	
HOW TO IMPROVE A WEAK CHIMNEY	36-40

A Tea-Kettle Boils Quicker on my Chimney than on my Stove.

IS IT SO?

It is said that a tea-kettle will boil quickest on top of a chimney. However that may be, all agree that there is too much heat wasted there. Nothing but the cross tube **ROCHESTER RADIATOR** has ever trapped it. If you were to heat a poker, would you hold it at the side of the flame or over the top? Or would you cook food on the side of a cook-stove in preference to the top? It is thus with the **ROCHESTER RADIATOR**, which takes the heat from the top of the current and not from the side. The cross tubes cool the hot current, just as you would blow across a cup of tea to cool it, only there are from 96 to 120 such currents in operation.

ROCHESTER RADIATOR CO.,

100 Furnace St., ROCHESTER, N. Y.

WINCHESTER

How often success in man or goods is ascribed to "luck." We all know better. Intelligence, ability, diligence and merit make for success and not for failure. Do you suppose the "WINCHESTER" steam or water heater would have proved the success it has if it were merely "lucky"? Made by Smith & Thayer Co., Boston, Mass.

The SAVORY Roaster. SEAMLESS.

The Roaster that is used by the most prominent chefs in the world is good enough for anybody. This is the

SAVORY SEAMLESS ROASTER.

The bottom is oval, seamless and raised off the oven. This makes it self-basting,

easy to clean, and impossible to burn or dry up the meat.

Some of your customers have no use for an ordinary cheap roaster. Try them on a SAVORY.

ABOUT ESTIMATE BOOKS

For Plumbers and
Heating Men

Your Contract and Estimate Record Book for Plumbers is one of the best books that ever came into our house and we would not be without it for three times the amount it cost. We can figure without omitting anything with accuracy at a very short time. We think that every plumber should not be without this valuable book.

W. C. BENNETT & CO., Haverhill, Mass.

We have used an estimate book for three years and could not do without one. Would say that yours is far superior to any yet used and can cheerfully recommend it.

W. R. PARK & SON, Taunton, Mass.

A great advantage. Prevents the leaving out of small items, which amount to more than the cost of the book in a very short time.

CHAS. W. COOMBS, Lawrence, Mass.

Your Contract and Estimate Record Book has been of great use to me in both the saving of money and labor, and I would highly recommend it to any or all master plumbers.

THOMAS P. DOHERTY, Taunton, Mass.

These testimonials are a few of many, and indicate both that a well arranged estimate book, which provides complete lists of items to be figured upon, is a time, labor and money saver, and that the "CONTRACT AND ESTIMATE RECORD BOOKS" come up to this requirement.

THE EDITIONS ARE AS FOLLOWS:

CONTRACT AND ESTIMATE RECORD BOOK FOR PLUMBERS

OFFICE EDITION.

200 Pages. Arranged for 100 Estimates.
Size 8 x 11 inches. Cloth bound, \$1.50
500 Pages. Arranged for 250 Estimates.
Size 8 x 11 inches. Cloth bound, \$2.50

POCKET EDITION.

200 Pages. Arranged for 50 Estimates.
Size 3½ x 8 in. (oblong). Flexible cloth
binding, \$0.50

CONTRACT AND ESTIMATE RECORD BOOK FOR STEAM AND HOT WATER HEATING

200 Pages. Arranged for 100 Estimates.
7 x 12 inches. Cloth bound, \$1.50

NOTE. The omission of one item in an estimate on a plumbing or heating job might result in the loss of all profit. These books provide a reliable, accurate, business-like record, and a sure means of avoiding loss due to mistakes and omissions.

Sent prepaid on receipt of price.

Zero Valve & Brass Mfg. Co.,
296 Seneca St., Buffalo, N. Y.**The Climax
RATCHET STOCK**

Is an indispensable tool for conveniently threading iron pipe in ditches, under floors, in corners, over head, etc. With this tool threads can be cut without removing whole lengths of pipe. This tool is provided with a strong vise which securely grips the pipe and by means of the leading thread the die is forced on pipe and the thread is cut. It is made of malleable iron and steel, and while light in weight, making it convenient to carry, is very strong and rigid. The advantages of this tool make it absolutely indispensable to Plumbers, Steam and Gas Pipe Fitters, Gas and Water Companies, Machinists, etc. It takes standard size dies, which are extra if furnished.

No. 1 threads $\frac{1}{4}$ to 1 in. pipe, takes 2 or $2\frac{1}{2}$ in. die, \$10.00.
No. 2 threads 1 to 2 in. pipe, takes $2\frac{1}{2}$, 3 and 4 in. die, \$17.00.
For sale by leading jobbers.

Retail Stove and Sheet Metal Associations.

In a recent issue mention was made of the organization of the retail stove and sheet metal working trades of Wilmington, Del., into an association for the purpose of mutual trade protection and the promotion of good feeling among the various concerns engaged in this class of business in the city. The subject of associations of retail merchants is one that is commanding increasing attention throughout the country at the present time. The movement has reached its highest development in connection with the retail hardware trade, but other branches of business in which our readers are interested are also taking it up. The Wilmington association is not the first organization of the kind. Already several associations of stove and furnace dealers and sheet metal workers are in operation in various cities in the East and South, and a movement is now on foot to form these local associations into a national organization, similar to that organized by the hardware associations. The tendency of the age appears to be marked in the direction of association in all branches of trade. The advantages derived from these organizations are obvious. Associations among retail dealers are accomplishing a great deal of good. They are working along the line of co-operation and from them advanced ideas are promulgated. The individual firms are benefited, acerbities of cutthroat competition are eliminated and a brotherly feeling is promoted which tends to the advantage of all concerned. It has been found that the trades in which these associations have been formed are elevated by the better feeling engendered among the members, and that distinct benefits accrue from the exchange of ideas and experiences which are developed at the meetings of the associations, whether in the nature of local gatherings or district, State or National conventions.

Electrical Heating.

The time when an electric wire can be run into a building and connected with an apparatus for heating the various rooms it may contain depends entirely upon how soon the cost of producing electricity can be brought down to a level at which it can compete with other methods of heating. At a recent exhibition of the Street Railway Association in Madison Square Garden, New York, where several manufacturers displayed the newest things in electrical heaters adapted for street car

use, one manufacturer announced that he had in course of completion an electrical heater adapted for heating rooms. This heater is intended to be used very much the same as a direct-indirect steam or hot water radiator. It is so constructed that its use is practicable wherever there is an electric lighting system, it being necessary merely to disconnect the wires from the ordinary illuminating globe and connect them with the electric heater. This device is designed to be placed in the window in such a way that on raising the window slightly a current of air will pass over the electric heater and flow into the building warm enough to maintain a comfortable temperature. It would seem that in a room having several windows one of the heaters would be necessary for each window, should the temperature drop to a sharp cold. These heaters, however, are designed only for use in moderately cold weather, and are not intended to supplant the usual heating apparatus when severe winter weather sets in.

The experts who have devoted their time to the reduction of the cost of car heating are devising electrical heaters adapted for that work. These all agree that if the expenses of running a plant, the wear and tear, repairs and all other such costs were charged against the heating of the offices at the power stations by electricity, it would be found that it would be cheaper to heat the building with a stove or some one of the other methods of heating in general use. The fact that electrical heaters are used in cars is not because they are cheaper than the coal stove, but on account of their other advantages. When stoves are used in a car the fire must be replenished with fuel, the ashes must be removed, and more or less dirt is made, which calls in an extra laborer to keep the car clean. Moreover, a large percentage of the coal is wasted, unconsumed. Taking these facts into consideration and comparing them with the extra cost of heating the car with electricity, it has been judged expedient to stand the higher expense in order to secure the greater convenience and comfort. There is nothing new in this conclusion, but when the best electrical heaters are shown in so important an exhibition and the views of experts in their manufacture are unanimous that electrical heating has not yet reached a point where it is available for use in all kinds of buildings, it seems clear that something has yet to be done along cheapening lines before the care, labor and dirt of the heating systems now in general use can be avoided by the adoption of electrical heating.

Central Station Heating.

If a building cannot yet be effectively and economically heated by pressing a button, a very substantial convenience in heating homes has been made available from electrical power stations. To generate electricity power is necessary, and this has been derived from the generation and use of steam in the engines that run the dynamos. Instead of allowing the exhaust steam from these engines to go to waste in the atmosphere, as was done in the past, it has been gathered in as one of the by-products of the power station, and saved in order to reduce the cost of producing electricity. A number of cities and towns throughout the country at the present

time have street heating systems which derive their heat from electrical power stations. In some cases the exhaust steam direct from the engines is being circulated along the streets, and through the mains and branches is carried into the residences and buildings of customers. Another method of using this steam is for heating water, which is similarly circulated through street mains and carried into the buildings of customers for heating purposes. The latter method seems to be gaining in popularity, as being more economical than steam heating. It is also found that there is less difficulty from expansion and contraction in the street mains and the branches leading from them. The customer, moreover, is not only furnished with heat without trouble to himself, but gets it in the degree suitable to the weather. Through expert supervision of the water heaters at the power station the water is circulated at a higher temperature when the weather is cold and at a lower temperature during mild spells. In consequence, the customer has no occasion to open or close a valve, but his house is heated to a proper degree under all changes of the weather. In view of the convenience derived from such central heating systems the desire for direct electrical heating loses much of its urgency.

The Metric System.

The metric system is to-day compulsory in twenty civilized countries, representing more than 300,000,000 inhabitants and embracing nearly all the leading nations of the world. Almost alone among the countries of any importance, the United States and Great Britain still hold out against its adoption. That this refusal to depart from our standards of weights and measures is operating to the disadvantage of our foreign trade is constantly being brought to the notice of American manufacturers and exporters by our consular representatives and others who have studied commercial conditions abroad. As an illustration of the inconvenience caused to foreign buyers, the United States Consul at Amsterdam cites a case where a firm in Holland received a cable offer from New York for two thousand barrels of potatoes. As this was a new business, the question at once arose how many pounds were there in a barrel of potatoes? A whole day was lost before the answer could be wired. Had the offer been made in kilograms every business man in the commercial world from Vladivostok to Mauritius would have understood it instantly. The necessity for American business men to adopt the metric system, at least for use in their foreign trade relations, is becoming more and more pronounced.

Labor in Japan.

According to United States Consul-General Bellows at Yokohama there is wide complaint in Japan of the lack of skilled labor. This want, it is claimed, is a serious hindrance to the introduction of foreign capital, so earnestly desired by progressive Japanese. While wages are low in Japan, it is pointed out by the local advocates of skilled labor that there is a great difference, as compared with Europe and America, as to the amount and quality of the work produced by the present poorly paid Japanese workmen. If this is taken into consideration, it is found that wages are relatively higher in Japan than in Europe and America. At present the condition of labor is deplorable. According to a native writer on social economics, children under ten years of age are largely employed in factories, and both men and women are generally made to work for injuriously ex-

cessive hours. Fourteen, 16 and even 18 hours a day are often worked in factories. There are more than 320 working days in the year, and yet the pay for this labor is infinitesimal, the amount in many cases being not more than \$5 or \$6 a month for from 14 to 17 hours' work a day. In many factories no provision whatever is made for suitable ventilation or sanitary facilities. Japan has no laws for the protection of labor or the restricting of the employment of women and children. But the subject is now being considerably discussed, and it is believed that some legislation of the kind will be introduced at the next session of the Japanese Diet. It is interesting to note in this connection that the agitation which has arisen for the betterment of the conditions of the Japanese laborer comes principally from the educated and professional classes, rather than from the laborers themselves.

Editorial Notes.

An Eastern concern, who are carrying on a plumbing, gas fitting and metal working business, adopted, some years ago, the policy of giving a house or its representative the opportunity of making but one quotation on any line of goods. It is well known to the trade that the concern do not "jew down" nor countenance "meeting prices." The member of the concern who does the buying keeps well posted on market conditions, and before making a purchase forms an idea of what the goods should cost. Two or three houses who are most likely to meet the requirements in quality and price are then requested to furnish quotations. The houses appreciate the conditions, and the concern usually receive satisfactory quotations without further inquiry. The policy saves much time and insures pleasant relations between buyer and seller.

An event of special significance connected with the meeting of the National Hardware Association at Cleveland last week was the formation of the American Hardware Manufacturers' Association. This project has often been considered, but until now no steps have been taken looking to concerted action in this direction. The movement starts in under most favorable auspices, and there will unquestionably be a large accession to the membership of the association. It promises to exert a wide influence and to be a source of benefit to manufacturers and the trade in general.

Ernest Schenk, president of the Crystal Palace Company of London, is now in this country in the interest of the American Exhibition, to be held in the Crystal Palace, from May to September, 1902, under the auspices of the American Society of London. The undertaking, Mr. Schenk says, promises to be the largest and most important exposition of American products, arts, industries and inventions ever seen in Europe. None other than American exhibits will be presented. One of the departments will embrace machinery and mechanical appliances of all kinds, together with hardware, tools and metal products, and another, that of hygiene, will take in lighting, heating, ventilating and sanitary appliances of every description. The other departments include natural and agricultural products, prepared food products, pharmaceutical and kindred preparations, carriages and vehicles of all kinds, textiles, fabrics and clothing, musical instruments, &c.

The final census report for 1900 places the population of the United States at 76,303,387, of whom 9,312,585 are colored, and 66,990,802 are white. The report shows that the males number 39,059,242, or 51.2 per cent. of the total population.

THE THOMPSON GAS FURNACE.

One of the newest furnaces to make its appearance, especially constructed to burn natural gas, is the Thompson furnace, made by the Springfield Furnace Company of Springfield, Ohio. The special feature of construction is the large amount of heating surface presented and the long travel the products of combustion are forced to make before they find an exit, the evident idea being to utilize, as far as possible, all of the heat from the products of combustion that is not necessary to aid the draft

The Thompson Gas Furnace.—Fig. 1.—Sectional Elevation.

in the chimney to carry them off. Fig. 1 is a sectional elevation, and Fig. 2 is a broken view of the base drum. A special burner is placed in a large combustion chamber, arranged as shown. This burner is so constructed that it gives to the gas and air entering a swirling motion, which effects a thorough mixture. This mixture is burned in a circular sheet with a central and an outer column of air. By this process a perfectly blue flame of very high temperature is secured as well as a very complete combustion of the gas. The burner is set in operation by means of a pilot light. This central combustion chamber is surmounted by an extended conical top. From the bottom of this extended top there are a number of round pipes which carry the products of combustion to the base drum shown in Fig. 2. From the outer chamber of this drum the hot gases are carried to the central flue through narrow, spoke like conduits.

Fig. 2.—Broken View of Base Drum.

From this central flue the chimney connection is made, as shown.

From the cuts and this explanation it will be seen that the hot gases are made to effect an indirect passage to the smoke flue. It will also be noted that the construction exposes a large expanse of surface, which is hottest at the top. The air on entering the furnace comes in contact with the warm surfaces and as it rises, with hotter and hotter surfaces, until the hottest surface is passed over just before the air enters the hot air pipes. The construction of the down flues of the furnace is such as to distribute the products of combustion evenly over the surface, so that all parts are said to be equally well heated. The furnace is made in several sizes adapted for heating different sizes of buildings. A catalogue can be secured on application, which gives full detailed explanation of its construction and operation.

Boynton Furnaces.

An attractively gotten up furnace catalogue and price-list for 1901-1902, consisting of 48 pages, has been issued by the Boynton Furnace Company, 207-209 Water street, New York, and 147-149 Lake street, Chicago. Several pages at the beginning are devoted to information under the head of "Important to the Trade," pointing out that it is necessary, in order to determine the size of furnaces required for given work, to get the size and character of the buildings, and many other features which have a bearing on successful heating. It is also stated that each line of Boynton coal furnaces, with the exception of school heaters and the Patriot and Special Niagara, has two series of numbers, one series covering furnaces with draw center grates, and the other with triangular revolving grates. The statement is made that all furnaces will be shipped with steel plate radiators unless especially ordered with cast iron radiators, and that a patent draft regulator is shipped with every furnace. Information is also given of the approximate and comparative heating capacity of the different furnaces, and of the various dimensions of the company's latest furnaces. Two pages show the different grates used by the house.

The place of honor in the catalogue is given to the Boynton school heater, which has made an enviable record in service. This is followed by the new gas tight self cleaning furnace, an all cast iron construction with a return flue radiator so designed as to present a large heating surface and to effect an indirect passage from it of the products of combustion. This is followed by the Boynton Renown furnace, sectional cuts being used in addition to broken views in order to make the construction thoroughly understood. The Boynton new steel dome furnace is made either a direct draft or indirect draft furnace by the manipulation of a damper. The Climax and Crusader are provided with corrugated fire pots and combustion chambers, in order to increase the heating surface, and are surmounted with either cast iron or steel drums, as may be desired. The Patriot and Special Niagara are two furnaces made either with cast iron or steel plate return flue radiators presenting a large amount of heating surface.

The catalogue also presents two styles of wood burning furnaces, adapted either for portable or brick setting and capable of burning wood 5 feet in length. By means of broken and transparent views the water heaters are shown in the various furnaces mentioned, adapted for service as combination hot water and hot air apparatus. Directions are also given for setting the Boynton furnaces in brick chambers, with full explanations and dimensions for the work. The Fire King circulating warm air heater and the Fire King heating stove are followed by a page devoted to the Boynton patent regulating ventilator and smoke pipe damper, which is furnished with all their furnaces. The catalogue contains a three-page price-list of hot air registers. The last page calls attention to the variety of ranges and steam and hot water heaters made by the house.

Star Ranges and Heaters.

We have received from the Enterprise Stove Company, Vincennes, Ind., a copy of the supplemental catalogue which they have issued showing some of their new patterns for the season of 1901. The company have been engaged in the business of stove manufacture for a period of 28 years, and feel that they are in a position to thoroughly understand the requirements of the trade. On the second page of the covers is a copy of the guarantee which the company give with every cook stove or range made by them, and accompanying it is the statement that if any stove of their manufacture, either cook or heater, cracks by fire inside of one year from the date of issue of the guarantee, they will furnish such casting free of charge. The new patterns which the company have brought out include ranges, cook stoves and heaters, of which the Magic and Domestic Star are steel ranges, and the Watson Star is a steel cook stove. These are made in the usual modifications and embody

the latest features of convenience and utility. The ornamentation is rich and effective, pleasing contracts being produced by the use of nickeled parts. In the way of new heating stoves may be mentioned the Model Star base burner, the Star Oak, with air tight base, and the Pilot Star, the latter being a handsome air tight for burning wood as a fuel. The Star radiator, another specialty for which the manufacturers make strong claims, can be used as a single or a double heater. The Starry Oak is a neat surface burning construction, which is offered at a low price and is made in three sizes.

The Wireton Time Regulator in Operation.

An illustration is presented herewith of the Wireton time regulator, showing its application to a warm air furnace. The Wireton automatic time draft is a device which automatically turns on the draft of a furnace or

The Wireton Time Regulator in Operation.

steam or hot water boiler at a certain time. It consists of a clock to which is connected a pivoted dog, which at the proper time releases a ratchet having attached to it chains which open the draft. This action of the ratchet is secured by a weight suitably attached in the basement. The clock is a standard alarm clock, and can be used as an alarm in conjunction with operating the heater drafts if so desired. At night the drafts may be turned completely off, and at 5 or 6 a.m., or any other predetermined hour for which the clock has been set, the regulator is released and the draft is automatically turned on. This device combines a time draft, draft regulator, a guaranteed time piece and an alarm clock, all in one.

The illustration shows the regulator attached to the wall of a room, with the chains passing to the basement and connected as they should be with the draft and check doors of the furnace. The arrangement will be easily understood from this illustration. It will be seen that during the day the drafts of the heater can be controlled at will by the regulator in the living room. This device is one of those happy inventions which meet with

an instant demand, evidently filling a long felt want. It is, therefore, a remarkable seller, and furnacemen who show it to their customers find that almost invariably this results in a sale. It is manufactured by the Wireton Heating Company, whose main office is at Blue Island, Ill., and Chicago office is at 40 Dearborn street.

ODD PLATES.

THE ENTERPRISE STOVE COMPANY, Vincennes, Ind., are distributing a little pamphlet of 20 pages of a size convenient to carry in the pocket, relating to the Gas Ranges which they manufacture. The object of the booklet is to show the advantages of gas as a fuel for domestic purposes. Reference is made to the efficiency, comfort, cleanliness and economy resulting from the use of gas as a fuel in cooking operations, and illustrations are given of the Star Progress and Star Imperial Gas Ranges. A feature of the little pamphlet which will strongly appeal to the housewife is found in a series of recipes of dishes which may be readily cooked by means of a Gas Range.

A LICENSE to incorporate has been issued to Max I. Heldman, Charles O. Reynolds, and James S. Shortle, who are organizing the Stearnes Steel Range Company at Chicago, with a capital stock of \$5000.

THE KELSEY FURNACE COMPANY of Syracuse, N. Y., advise us that the Kelsey Warm Air Generator received the silver medal and highest award for warm air heating apparatus at the Pan-American Exposition.

THE HANKS FOUNDRY & STOVE WORKS have recently been incorporated at Rome, Ga., with a capital stock of \$12,000, the object being to manufacture all kinds of Stoves. The incorporators include J. D. Hanks, W. W. Smith, and M. Z. Whitehead.

WITH the compliments of the Troy Nickel Works, manufacturers of Stove Trimmings, Albany, N. Y., a neat little pamphlet is being circulated among their friends and customers, containing the last speech of the late President McKinley, delivered at the Pan-American Exposition in Buffalo on September 5. A feature of the little book is an excellent portrait of the lamented President.

A LITTLE circular in a three-color effect, sent out by the Ideal Mfg. Company, Detroit, Mich., in the interest of the Ideal Ruby Gas Heater, is well calculated to draw the attention of the trade to this little Stove. It is 7½ inches in diameter, 25 inches high, made with a perforated steel body of dead black finish with nickel trimmings, and is equipped with a specially constructed gas burner of about 18 cubic feet capacity.

W. J. BURTON & Co., Detroit, Mich., inform us that they have improved their Burton Fuel Economizer by nickel plated trimmings. This gives the Economizer a more ornamental appearance, and is calculated to aid the dealer in effecting sales. The price of the device has not been advanced on account of the nickel plating.

A FOLDER, which is being sent out by the Pittsburgh Stove & Range Company of Pittsburgh, Pa., states that the Etna Furnace, which the company are prepared to furnish, is adapted to meet varied requirements. They state that 20 years' experience in Furnace making, with a constant study for possible improvements, has enabled them to produce in the Etna "the highest grade, most practical and most serviceable Furnace of this generation." The claims are made that it is constructed of the best materials, is simple in construction, and gives satisfactory results in operation.

THE VICTOR STOVE COMPANY, Salem, Ohio, are sending through the mail a calendar card for October calling attention to the Victor Stoves and Ranges, and suggesting to their customers the advisability of sending in orders promptly in order to be sure of getting their supplies in good time for the fall and winter trade. A cut is given of the Victor Oak, with the statement that this Stove can be furnished with hot blast pipe, inside fire pot and steel liners or magazine.

At the convention of the National Hardware Association, held last week in Cleveland, Ohio, the Champion

Steel Range Company of that city presented to the delegates as a souvenir an elegant enameled cigar ash tray, which was highly appreciated by the recipients.

A RECENT ISSUE of the *Detroit Press* contained a very interesting description of "How a Stove is Made," the account being based upon the observations of a representative of the paper who visited the extensive plant of the Detroit Stove Works. A bird's-eye view of the works occupies the entire width of the paper at the head of the page containing the article in question. There is also a general view of the Western warehouse, office and salesrooms erected in Chicago in 1893 by the company named.

"EVERY MINUTE COUNTS" is the head line of a card printed in colors, which is being sent out by H. Adler & Co. of Pittsburgh, Pa. The picture accompanying the text represents a steam fire engine drawn by galloping horses, and evidently on the way to a fire. Obviously, in such a case, every minute counts, and the company point out that "every hour means an age when you have a ripe sale but cannot get the goods." They state that they can fill every order the same day it is received, as their capacity is a Stove every minute packed and ready for delivery. Their output last year is stated to have been 65,000 Stoves and "nobody had to wait." The company make Gas Stoves and Heaters of all kinds, and have issued an illustrated catalogue known as No. 34, which gives full information regarding their specialties.

THE MICHIGAN STOVE COMPANY are furnishing to their agents, to be used for advertising purposes, a pocket portfolio envelope. This envelope is manufactured of very stout paper, and is of a size and shape making it suitable for inclosing documents to be preserved from wear and tear when carried in the pocket. The envelope bears on it tables giving the population of the largest cities in the Union and of the various States, as well as blanks to be filled up for the personal identification of the owner.

A POSTER announces the sale by the assignee of the plant of the Schuylkill Valley Stove Company at Spring City, Pa., on November 1 at 2 o'clock. The sale will take place on the premises, which contain 5 acres of land on two lines of transportation. A description is given of the buildings, equipment, patterns and stock. The assignee, George D. Peters, announces that the property will be disposed of at public sale and that 10 per cent. of the purchase money must be in cash and the balance must be paid in 30 days, with security in the meantime.

Exposition of Alcohol Consuming Apparatus in Paris.

The enormous production of alcohol in France has led M. Jean Dupuy, Minister of Agriculture, to offer a series of prizes for any kind of apparatus or machinery that will open a way for its greater consumption. United States Consul Covert, at Lyons, reports that an exhibition of inventions for the use of alcohol for illuminating or heating purposes or for motor power will be given in Paris in the grand palace of the exposition, Champs Elysées, from November 16 to 24. The prizes awarded will consist of a series of medals. The exhibition and experiments will be divided into three classes:

1. Stationary motors, motors for navigation, locomobiles and motors for working pumps, automobiles under 25 horse-power, insulated carburetors.
2. Incandescent lighting, divided in two classes: (1) Apparatus using pure medicated alcohol; (2) apparatus using carbureted alcohol.
3. Heating apartments, bath houses and hothouses for flowers, chafing dishes, dish warmers, flat iron heaters, curling irons, lamps, &c.

It is not stated whether the citizens of other countries will be permitted to compete for the prizes, but, in any case, the Consul says, the presence of Americans in Paris with their apparatus for the consumption of alcohol would furnish a good opportunity for introducing their goods into the French market. Mr. Covert further suggests to Americans who may attend the coming exhibition that lighting, heating and cooking apparatus

will be likely to receive favorable attention in France, where coal is dear and oil pays a high customs duty, as well as freight over 3000 or 4000 miles of land and sea. It is possible that a small handy cooking apparatus, heated by alcohol, would fill a want. All over France there are thousands of people who lead an isolated existence in one room, up four or six flights of stairs, who would prepare their first meal of coffee or chocolate and their evening soup on such a contrivance. The national custom, especially among the poor and middle class, is to take these two meals in a cheap restaurant; but customs change, and the effort to introduce new uses for alcohol may be a means of breaking up this habit—above all, if it is in harmony with ideas of strict economy.

A NEGRO TRADE SCHOOL.

We have received the thirty-third annual report of the Hampton Normal and Agricultural Institute of Hampton, Va., covering the year ending June 30, 1901. This report shows that the institution is doing excellent and valuable work in imparting instruction in the trades to colored youths. During the past season 165 students were taught the blacksmithing, wheelwrighting, carpentry, painting, tinsmithing, steam fitting, machinists', brick laying, shoemaking, tailoring and upholstering trades in the Armstrong-Slater Trade School, which was opened a few years ago as a memorial to the late General S. C. Armstrong, the founder of the Hampton Institute. The industrial department of the institute is given special prominence in the curriculum of the school. Since 1868, when the school was founded, about 5000 young men have gone out of the institution equipped with the wherewithal to earn their living at some manual trade. Of the students who have been taught trades about 70 per cent. are said to be now either working at them or teaching them. Many of these have opened shops in various parts of the South, and have succeeded in building up a good business and thereby earning more than a competence.

The plant of the Hampton Institute is valued at \$600,000. It is free from debt and is exempt from taxation. There are 55 buildings, including large dormitories, agriculture and domestic science buildings, a memorial church, academic buildings and shops in which instruction is given in 16 trades. The institute also owns two farms and about 800 acres of land. The trade school, which was opened five years ago, is equipped with facilities unsurpassed anywhere in the South for the training of mechanics. The trade instruction is supplementary to the general educational course, the idea being to provide the students with a well grounded manual and mechanical equipment. All the work of the various trades done about the Institute is carried on by the students under the direction of their instructors. Mechanical drawing is taught to all the students in the trade school. A recent addition is an iron foundry equipment, which has just been purchased and is to be put in operation at once.

The value of this kind of industrial training to the colored youths of the South can scarcely be overestimated. It enables them to become useful, self supporting and self respecting members of the community. The Hampton Institute is the parent of the Tuskegee, Calhoun and several other industrial schools for negroes which are now doing such good work in the South. Undertakings of this class probably furnish the best solution of the much discussed problem of how to help the Southern negro.

THE NATIONAL LEAD COMPANY, Atlantic Branch, 100 William street, New York, are distributing a 24-page circular in the interests of their Solders. These include Solders of all grades and in every form, Bar, Ingot and Triangle in Bar or Drops; also Wire and Strip Solder. An interesting feature of the catalogue is the fact that the company are offering no less than five qualities of Half and Half Solder. Tables are also provided, giving the sizes and weights of the National Lead Company's Lead Pipe, Lead and Tin Tubing, Tin Lined Lead Pipe, Block Tin Pipe and Sheet Lead.

AMERICAN HARDWARE MANUFACTURERS' ASSOCIATION ORGANIZED.

The banquet hall of the Hollenden Hotel, Cleveland, Ohio, was crowded on Wednesday afternoon, October 9, with hardware manufacturers and their representatives, who met with the object of considering the advisability of forming a manufacturers' association. The meeting was called to order by H. B. Lupton, who nominated Robert Garland of the Standard Chain Company as temporary chairman, F. G. Mitchell being elected temporary secretary.

Mr. Garland made an able address, pointing out the desirability of the formation of an organization by the manufacturers of hardware. He was supported along similar lines by a number of other manufacturers present. The chairman explained that the association would in no way try to fix prices, but that its object would be simply to broaden their field and make the trade understand, for example, what 10 and 30 days mean; what a contract is; perhaps to formulate a uniform contract; to reach an understanding concerning guarantees, &c. The association would meet twice a year at the hardware jobbers' conventions. On motion a committee of ten was appointed to report a basis of organization the following day.

On Thursday morning the American Hardware Manufacturers' Association was formed at a second meeting in the Hollenden Hotel, Chairman Robert Garland presiding. C. S. Van Wagoner, president of the Van Wagoner Company, chairman of the Provisional Committee, reported as follows:

Your committee appointed for the purpose of formulating plans for a permanent organization begs to report as follows:

That this association shall be known as the American Hardware Manufacturers' Association.

OBJECT: To further the interests of the manufacturers and promote cordial relations with the distributors.

It is recommended that a permanent organization be effected, consisting of the following officers:

President:

Fayette R. Plumb, Fayette R. Plumb, Incorporated, Philadelphia, Pa.

Vice-Presidents:

Samuel M. Nicholson, Nicholson File Company, Providence, R. I.
C. S. Van Wagoner, Van Wagoner Company, Cleveland, Ohio.
F. S. Kretsinger, Iowa Farming Tool Company, Fort Madison, Iowa.

Secretary-Treasurer:

F. D. Mitchell, Standard Chain Company, Pittsburgh, Pa.

Executive Committee:

Robert Garland, Standard Chain Company, Pittsburgh, Pa.
Henry B. Lupton, Oliver Iron & Steel Company, Pittsburgh, Pa.
N. A. Gladding, E. C. Atkins & Co., Indianapolis, Ind.
W. S. McKinney, McKinney Mfg. Company, Allegheny, Pa.
Samuel Disston, Henry Disston & Sons, Philadelphia, Pa.
C. E. Adams, Cleveland Hardware Company, Cleveland, Ohio.
James Kelly, Kelly Axe Mfg. Company, Alexandria, Ind.
J. C. Birge, St. Louis Shovel Company, St. Louis, Mo.

The report was accepted by unanimous vote, and Fayette R. Plumb, the newly elected president, took the chair, and made an able and luminous address. Between 80 and 90 manufacturers applied for membership in the association, and a Committee on Membership was appointed, to whom the eligibility of applicants for membership was referred.

There was some discussion as to the houses which should be eligible for membership. The general consensus of opinion was that membership should be limited to manufacturers, and the matter was thus determined as per the following resolutions, which were unanimously adopted:

Resolved, That the American Hardware Association be composed exclusively and strictly of manufacturers of goods handled by the Hardware trade.

As the matter is thus decided, any firm or corporation engaged in the manufacture of goods handled by the hardware trade may, upon the recommendation of the Membership Committee and the unanimous consent of the Executive Committee, become a member of the association by subscribing to the constitution and by-laws and the payment of the membership fee of \$10. It has also been determined that no manufacturer who is also engaged in the jobbing business can become a member,

nor are manufacturers' agents eligible to membership in the association. Applications for membership should be mailed to F. D. Mitchell, secretary and treasurer, First National Bank Building, Pittsburgh, Pa., to secure prompt attention from the Committee on Membership.

New England Hardware Dealers' Association.

The regular monthly meeting and dinner of the New England Hardware Dealers' Association was held at the United States Hotel, Boston, Wednesday evening, October 9. About 60 members were present. Mayor Thomas N. Hart was their principal guest, and he made a very interesting address relative to Boston and its improvements during the past two years. Among the other speakers were James N. Frye, Charles A. Burditt, George S. Saunders and Anthony S. Morss, all of whom related reminiscences of their early hardware experiences in or near Dock Square, Boston.

The association invited the following, who are the oldest Hardwaremen of Boston, to be present at this meeting, but the first four mentioned were unable to be present owing to their advanced age: Nathaniel B. Doggett, George T. Carter, George Allen, Martin L. Bradford, George S. Saunders, Charles A. Burditt and Daniel Goodnow. Music was furnished during the dinner by a trombone quartette from the Lynn Cadet Band, and the selections were much enjoyed.

The National Hardware Association.

The seventh annual convention of the National Hardware Association, held at Cleveland, Ohio, closed on Friday, October 11, after electing the following officers for the ensuing year:

President, R. A. Kirk, Farwell, Ozmun, Kirk & Co., St. Paul, Minn.

First Vice-President, John C. Koch, John Pritzlaff Hardware Company, Milwaukee, Wis.

Second Vice-President, Brace Hayden, Dunham, Carri-gan & Hayden Company, San Francisco, Cal.

Secretary-Treasurer, T. James Fernley, Philadelphia, Pa.

W. S. Wright of Omaha, Neb., and Col. R. M. Dudley of Nashville, Tenn., were chosen members of the Executive Committee, the other members being Samuel Bigelow of Boston, Mass.; W. R. Belknap of Louisville, Ky.; P. E. Strauss, Boston, Mass., and J. D. Moore of Birmingham, Ala.

It was decided to hold the eighth annual convention of the association in New Orleans, La.

The Sherman Hose Coupling.

Shown herewith is a hose coupling stamped from sheet brass offered by the H. B. Sherman Mfg. Company, Battle Creek, Mich. It is referred to as having all

The Sherman Hose Coupling.

of the essential features of the cast coupling, with the following improvements: That it gives a full water way in the hose, that it presents a finished appearance in the hose, that the knurled flanges on the union nut afford a better grip for the hand in making connections, that the use of sheet brass drawn into the form shown in this coupling does away with sand holes and flaws, that all parts are made from very heavy sheet brass, that it is a solid, substantial article, designed to give satisfaction under all conditions; that the coupling shanks are deeply corrugated, which is a great advantage in itself, as it enables the coupling to be clamped in the hose securely, and that each of the three parts of the coupling is complete in itself, being seamless and made from one piece, there being no soldered joints.

The Gem Portable Pivoted Garbage Receptacle.

Illustrated herewith is a garbage receptacle, placed on the market by Cameron & Purks, Philadelphia, Pa. The device is easily adjusted to a fence, and is centered for the outward swing on malleable iron pivots and cleats.

Fig. 1.—Gem Portable Pivoted Garbage Receptacle, Yard Side.

Fig. 2.—Garbage Receptacle on Public Side.

It is so arranged as to automatically return to its original position. The lid is mounted on the fence and so adjusted, it is explained, that when opened it must return to the closed position, thus preventing disagreeable odors arising from the receptacle, due to bad fitting or open lids. The receptacle is made of heavy galvanized iron and has a capacity of a bushel of refuse. In dumping it swings to an angle of 45 degrees, and when desired can be lifted from its pivots for cleaning, repairs, &c., and easily replaced. A device is also attached for locking the receptacle on the inner side of the fence, so that it can be emptied at will, at the same time preventing its being tampered with from the outside.

Improved Russell Staple Puller.

The Utica Drop Forge & Tool Company, Utica, N. Y., for whom Smith & Hemenway Company, 296 Broadway, New York, are direct representatives, have brought out an improved form of the Russell staple puller, as shown herewith. The new features include a device between the jaws and the pivot for tying barbed wire, and a wire splicer on the opposite side of pivot for splicing plain wire. Other changes are in the form or shape of the jaw ends, which now have a flat surface and larger hammer surfaces on both sides of jaws. Other details

Improved Russell Staple Puller and Combination Tool.

of this combination tool are two staple pullers, pincers, monkey wrench, two nail pullers and two wire cutters. It is 10½ inches long and weighs 1½ pounds.

Victor Vegetable Masher.

Goodell Company, Antrim, N. H., and 10 Warren street, New York, manufacturers of cutlery and hardware specialties, supplementing their line of bread crumbing machines of somewhat similar construction, have just put on the market the Victor vegetable masher, here illustrated. Potatoes, turnips or vegetables of

like character to be mashed after cooking are thrown into the hopper, the top dimensions of which are 13 x 14 inches, with an extreme depth of 14 inches, when by means of a three-blade reverse curve or S shaped spider, in each of which are three rectangular openings, the material is quickly forced through sieves at the bottom which have a 3-16-inch mesh. The mashing capacity of the machine is given as a bushel of cooked vegetables in four minutes or less. This device is also recommended for mashing fruit, and is intended for such places as hotels, restaurants, boarding houses, clubs, steamships, canning, preserving and yeast factories, &c. It is said to convert potatoes into a light, flaky and smooth body of even grain. The sieves will not clog and can be taken out for washing and quickly reassembled. There are few pieces in this machine, all the working parts are tinned to prevent rust, and it is solidly built

Victor Vegetable and Fruit Masher.

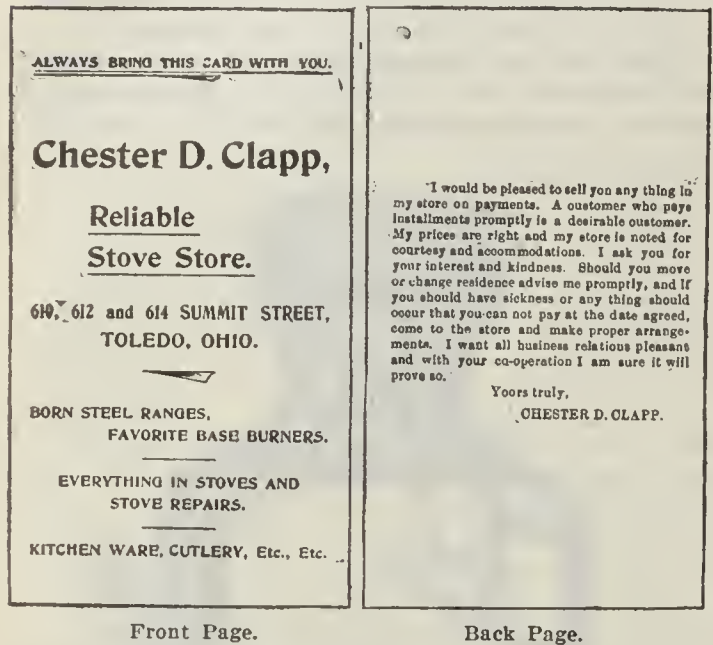

to stand hard usage. We are advised that some of the machines have been tested 18 months in hotels and large kitchens, the device being the idea of a practical hotel man.

THE CLARK NOVELTY COMPANY, Rochester, N. Y., are mailing to the trade an attractive booklet showing many sizes and styles of their Brass Faucets for milk cans, cream separators, water coolers and oil cans. The company have gained an excellent reputation during the past 12 years as manufacturers of this particular line of

goods. They state, as a gratifying fact, that during the past season they have not received one word of complaint in regard to these goods from any of their hundreds of customers. The growth of this branch of their business has compelled the concern to devise several special machines and tools especially adapted for the finishing and grinding of Brass Faucets. The improved facilities thus provided enable the company to turn out a large quantity of goods of the highest quality. They invite those who use or handle Brass Faucets of any kind to communicate with them before closing their contracts for the coming season.

CREDIT SALES AND COLLECTION OF ACCOUNTS.

Merchants not infrequently look upon the credit part of their business as undesirable, if not an evil which they prefer to avoid. To desire and encourage such trade is unusual. Chester D. Clapp of Toledo, Ohio, looks at the matter in another light, and is doing a large credit business with satisfactory results. A considerable portion of the business is done on the installment or

Front Page. Back Page.

Fig. 1.—Folding Card for Credit Sales.

easy payment plan. This plan covers Stoves, Washing Machines, Wringers, Tools, &c., and he has sold Christmas gifts on payments. Mr. Clapp expresses the opinion that the majority of all Stoves are now being sold in this way. The average furniture dealer is referred to as charging \$45 to \$50 for the same size and style of Range that the average Hardware and Stove dealer sells for \$40, yet the furniture man makes the greatest number of sales.

The folding card, the front and back pages of which are shown in Fig. 1, reduced in size, has been found con-

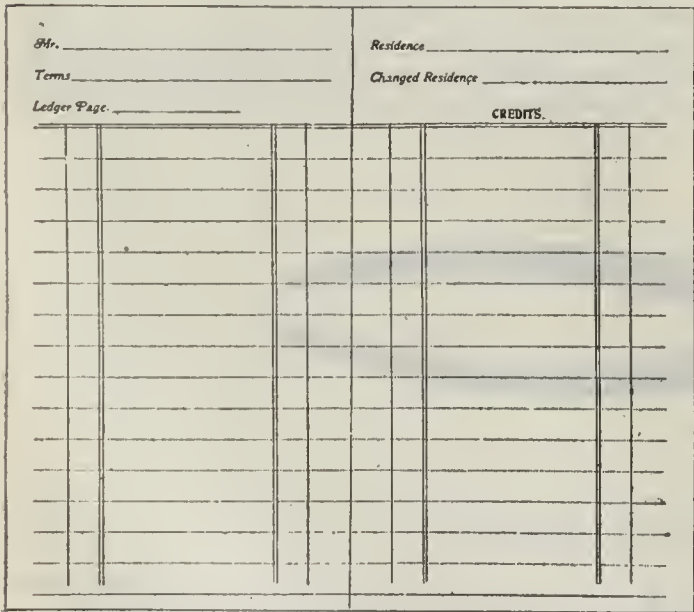

Fig. 2.—Inside Pages of Folding Card. Actual Size 6¼ x 5½ Inches.

venient and practical to use when merchandise of any kind is sold on payments or credit. It is 6¼ inches wide by 5½ inches long, printed on good stiff manila paper, made to fold in the center. The printed matter on the back cover is in a courteous form, to convey to the credit customer the idea that his trade is not only sought after, but that it is valued as much as that of cash customers.

The inside pages, reduced in size in Fig. 2, are arranged with the proper spaces for entering the goods sold, and the credits as payments are made. The customer retains this card. It has been found that the card answers its purpose much better than the ordinary bill or statement of account; that it will stand more wear and tear; that it gives a better opportunity to display advertising matter conspicuously; that the notice regarding payments is read and complied with more readily than the abrupt demand written in red ink, which usually appears on the statement of account, and that it tends to make customers more frank in their dealings with the merchant.

The Tickler, illustrated in Fig. 3, reduced in size, is used in connection with the sale of goods on payments, or in the collection of delinquent accounts. This card is made of somewhat heavier manila stock than the one shown in Fig. 1. It is 3¾ inches wide by 8½ inches long. In connection with the Ticklers a cabinet is used, having 31 compartments, each compartment representing a day of the month. Each Tickler used contains a full statement of a customer's account, posted up promptly as payments are made. Each Tickler is placed in the compartment representing the day of the month when payment is promised or expected, and moved from one date to another as necessity requires. For instance, the Tickler of a customer who pays promptly on the 10th of each month is never disturbed; but, if tardy, and he promises

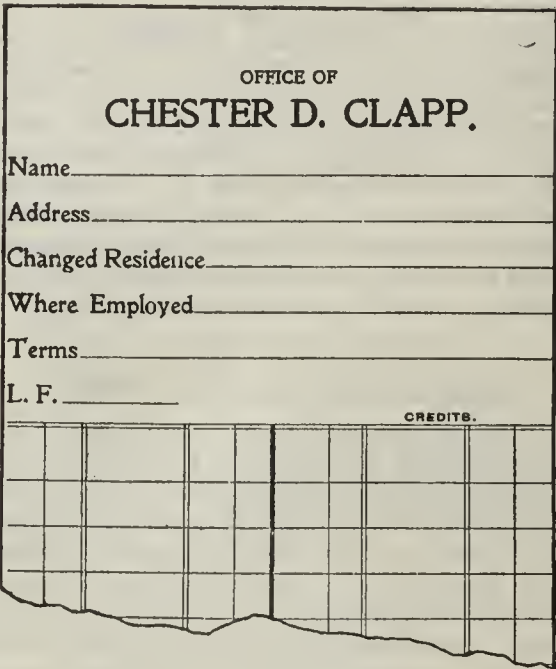

Fig. 3.—Tickler. Actual Size 3¾ x 8½ Inches.

to pay on the 20th or 25th, his Tickler is moved forward to that date. If wholly delinquent, the Tickler is taken from the cabinet and is kept with others for prompt adjustment in some way. The collector takes the Ticklers when making his calls for payment, a record being kept at the office of any Ticklers taken away for such purpose. The ledger account is kept up as well as the cards. Among the advantages of the system are the following: That the system is simple; that it saves making out so many statements; that promises made the merchant are before him each day, and that the Tickler containing the entire account is portable and can be changed from cabinet to desk, given to collector, &c., with greater facility than memoranda.

Mr. Clapp advises merchants to pay less attention to selling Wire, Nails, Poultry Netting, also to soliciting contractors' and manufacturers' trade, and cultivate the profitable household trade with the same weapons that are being used by merchants in other lines. He remarks that the average John marries his Emma with \$100 to his account in the bank, and needs \$200 to \$300 worth of goods to begin housekeeping. He adds, such accounts are seldom found to be delinquent, but are paid as agreed upon, and more goods bought. The opinion is expressed that this system of doing business will pay, no matter how small the town.

The American Aluminum Association.

At a meeting of thirteen representatives of firms manufacturing or dealing in aluminum goods held last month at the Genesee Hotel, Buffalo, N. Y., an organization was formed under the name of the American Aluminum Association. The object of the association is to improve the condition of the aluminum industry and to promote a more friendly feeling among the different concerns engaged in it. The following officers were elected to serve until the first annual meeting of the association:

President, Joseph A. Steiunetz of Janney, Steinmetz & Co., Philadelphia.

First Vice-President, W. F. Pfueger of the Manitowoc Aluminum Novelty Company, Manitowoc, Wis.

Second Vice-President, W. H. Wagner of the Wagner Mfg. Company, Sidney, Ohio.

Secretary-Treasurer, Palmer H. Langdon, New York.

Committees were appointed to deal with the subjects of Metallurgy, Novelties, Cooking Utensils, Combs and Dealers, and an interesting and fruitful discussion on trade topics was held. The necessity of manufacturing goods of the best quality and of maintaining fair prices was particularly insisted upon. No agreement on prices was made at the meeting, but a general understanding was arrived at that they would be maintained at a reasonable figure to insure fair profits. Several concerns that were not represented at the meeting have since joined the association, which includes in its membership nearly all the leading firms engaged in the aluminum trade.

Dietz Lanterns.

For over 60 years the name of Dietz has been connected with lanterns, the business of the R. E. Dietz Company of New York having been established as far back as 1840. The company have just published a 64-page catalogue covering some of the many styles of Dietz tubular lamps and lanterns manufactured by them. The catalogue, which is of small and convenient size, gives a cut of the factory of the concern in New York City, which is claimed to be the largest establishment of its kind in the world. A view is also given of their factory at Syracuse, N. Y., formerly the works of the Steam Gauge & Lantern Company. Hand lanterns of all kinds, bracket lanterns, street lamps, driving lamps, automobile lamps, bicycle lamps, locomotive head lights, and commercial, railway and other lanterns are included in the assortment presented in this publication. In a preface the company lay special emphasis upon the absolute safety of their lanterns. The oil pots of all the Dietz tubular lanterns are said to be drawn out from a solid sheet of tin and the bottom plate set in. This method of manufacture, it is said, insures their lasting quality. All the material used in the manufacture of the goods is of the highest quality. The burners are stiff and strong, and the globes are of extra grade, made from the company's own molds, to fit the lanterns. The goods shown in the present catalogue cover a very wide range, from the largest locomotive headlight to tiny Baby brass lantern, which is said to be the smallest lantern made.

Wagner Hollow Ware.

The Wagner Mfg. Company of Sidney, Ohio, have just issued an attractively gotten up catalogue of 72 pages, covering the line of high grade iron and aluminum hollow ware of which they are the manufacturers. The book is bound in gray covers, with black and silver ornamentation and lettering, and is known as Catalogue No. 10. Views of the company's two factories are represented on the opening page. The introduction states that in addition to these, two new buildings are rapidly being erected—one for the production of the company's new aluminum goods, the other being a large and commodious office to take care of their increasing business. Illustrations of the medals awarded to Wagner hollow

ware at the World's Fair at Chicago, the Paris International Exposition of 1900, and the Nashville Centennial Exposition, together with a view of the company's elaborate exhibit at the Pau-American Exposition at Buffalo, occupy the following pages.

Fifteen pages are devoted to aluminum ware, embracing tea kettles, pudding pans, sauce pans, skillets, broilers, dippers, ladles, cups, scoops, funnels, and a number of other articles, also cast aluminum letters and numbers, of which the concern make a large variety. Wagner nickel plated ware is shown in eight pages. These comprise skillets, kettles, griddles, cooking pots, Dutch ovens and tea kettles. In order to increase the sale of their nickel plated ware and to give the dealer an opportunity of displaying it to more advantage, the company offer to give free a handsome display rack in white nickel finish. A variety of polished ware occupies a number of pages, followed by ordinary hollow ware, the latter including a number of specialties such as the Wagner improved boiler and the Wagner ball bearing waffle iron. The closing pages of the catalogue show a variety of goods, including stove lids, stove leg rests, stove lifters, coal grates and ventilator grates, cylinder rings, sugar kettles, ash doors and frames, street and gutter crossings, gas burners, tuyere irons, cast iron water conductors, sash weights and other cast iron goods.

Stove and Hardware Dealers.

HERMAN MOLLENHAUER has opened a new Hardware and House Furnishing Goods store at Yorktown, Texas.

AN artistically gotten up booklet is being distributed by the R. E. Dietz Company, 60 Lighthouse street, New York, advertising the Dietz New Steel Signal Lamps, that are claimed to be among the strongest, most compact and thoroughly up to date Signal Lamps made. Illustrations of the Lamps are presented, some of which are in colors, showing the green and red lenses used for signal purposes.

N. P. WILD has bought the Hardware and Tinware business of the late Daniel Palmer, at Valatie, N. Y.

A. C. L. WUNDER has started in the retail Hardware, Tinware and Stove business, at Walcott, Idaho.

At the convention of the National Hardware Association in Cleveland, Ohio, last week, the Dover Mfg. Company of Canal Dover, Ohio, presented the delegates and visitors with a miniature Sad Iron as a souvenir of the occasion.

THE MICHIGAN HARDWARE MFG. COMPANY, Grand Rapids, Mich., have issued a catalogue of Stove Boards, Sheet Metal Ceiling and the improved Gem Hose Plier. The company's new crystallized metal covered Stove Boards are manufactured with the edges on the underside of the base forced into the wood in such a manner as to avert all danger of projecting outward and becoming entangled with carpet or rugs or severing the covering of the base or wooden bottom. The catalogue illustrates a variety of the designs which have been originated by this company. The Metal Ceilings shown are also of original and pleasing designs. The Gem Hose Plier is designed for coupling and mending Garden Hose, and is a very ingenious tool, embodying a number of features which make it especially valuable in this line.

E. M. Lang, senior member of the firm of E. M. Lang & Son, solder manufacturers, of Portland, Maine, died October 9 at his home in Falmouth, Maine, after a short illness. Mr. Lang was one of the pioneers in the can business of the United States, in which he was engaged about 40 years ago. Later he branched off into the manufacture of solder on an extensive scale and established one of the largest businesses in this line in the United States. Mr. Lang was 68 years of age, and was one of the most prominent and respected citizens of Portland. He leaves a widow and five children. One of his sons, E. M. Lang, Jr., is the treasurer of the solder firm.

VENTILATION AND HEATING OF BUILDINGS.*

The problem of how to heat economically and yet efficiently has been and is both a complicated and difficult one, owing to the many circumstances of latitude, exposure, nature of employment of inmates, number of occupants of dwelling, and so on, and yet there are some primary principles which must be fully understood if even a moderate degree of success is to be attained. I shall attempt to outline these in order of importance as they appeal to me.

Owing to the constant atmospheric movements of external air it must be remembered that the external air is, even in cities, infinitely purer than the best house air under ordinary conditions. For instance, Dr. Paul Regnard quotes a table from Miquel giving the bacteria per cubic meter in air as follows:

Bacteria in Air.

Air over the Atlantic.....	0.6
Air of Paris at summit of Panthéon.....	1,200
Air of Paris in Rue de Rivoli.....	3,480
Air of Paris in a new house.....	4,500
Air of Paris in the sewers.....	6,000
Air of Paris in an old house.....	36,000
Air of Paris in the Hôpital de la Pitié.....	79,000

Or, as Regnard says, a patient in La Pitié inhales 790,000 bacteria daily.

As regards chemical constituents, Dr. Angus Smlth, Saussure, Muntz and others have found that the carbonic acid of the purest and most impure outer air does not vary more than between 2 and 4 parts in 10,000, whether on mountain top or in the slums of great cities. To illustrate further, Pasteur and Tyndall both found that sterilized solutions of beef bouillon could not be exposed a moment in a room without danger of infection by some floating microbe, while on the mountains outer air was practically sterile. Clearly, then, our problem involves the introduction into houses or living rooms of a reasonable amount of outer air, if we believe that fresh air is necessary to health. Now it is quite apparent that we are at once confronted with the question of how to do it, and how to pay for it. After much consideration I am convinced that it is possible, with reasonable economy to keep house air fresh, but only by an appreciation of the several physical laws entering into the problem.

First, the construction of a warm building—this is our first point. But, some one says, here again it is a matter of cost. Partly so, and only partly so. Practically we have three building materials—stone, brick and wood. Speaking of refrigerating machines, Leask remarks that a large percentage of the actual work done is required to make up for the transfer of heat through the walls, floors and ceilings occasioned by poor insulation, which amount may be measured experimentally. Tables are given as illustrating the varying conducting powers of substances. Professor Shaw of Cambridge indeed gives a formula for estimating the amount of heat lost in one hour by conduction through an area of 1 foot square of different substances of 1 inch in thickness, with a difference on the two sides of from 1 per cent. upward.

Conducting Properties of Materials.

	Units.		Units.
Copper conducts.....	3,225.0	Cork	0.90
Iron	477.0	Water	5.82
Stone.....	17.9	Air	0.16
Brick	4.3	Glass	6.66
Oak (across fiber)...	1.70	Slag wool.....	0.314
Brick dust.....	1.00	Asbestos	Same as above.
Coke	0.99	Paper	0.20

It is thus apparent that enormous differences exist in the conducting powers of our several building materials, and that very important facts regarding the conducting powers of other substances may become of practical service to us under many circumstances. Thus Leask gives several examples, of which the following illustrates the successful arrangement for a refrigerator wall:

Outer wall, 14 inches of brick.
Next inner wall, 4 inches of pitch and ashes.
Next inner wall, 4 inches of brick.

Next inner wall, 4 inches of air space.
Next inner wall, 14 inches of brick.

But assuming that we are to build an ordinary 14-foot wall, we must see that two points are well attended to (a) that the mortar is laid so that the wall is not a sieve, and (b) that its inner surface is grouted and a good striping is laid on tar paper, with an air space between this and the plaster, and thereby get at least some of the non-conducting conditions we are seeking.

But the question will be asked, what difference can the wall make if the air is to be frequently changed?

ONE RESULT OF FREQUENT CHANGE OF AIR.

An example will probably best illustrate the case. Assume a room with two outer walls of 30 feet each by 16 feet in height and 1 foot in thickness. This represents 900 square feet of external radiating surface. Assume that 1 inch thick with 1 degree of difference between outer and inner air means in heat a loss of 4 heat units, one-twelfth of this is lost with a foot in thickness, or 300 heat units per hour. Let the difference in temperature be between 60 degrees F. and zero, and not only will there be a loss of 60 times as many units of heat, but the rate of loss of heat is directly proportional in rapidity to the difference between the internal and external temperature. But assuming that this most important matter of making a building warm, compatible with moderate first cost, is accomplished, we have still the problem of heating. It is apparent that houses, essentially dwellings, must most concern us. Warehouses and similar large buildings are usually filled with goods, rather than people, but schools, workrooms and factories, as well as dwellings, must claim our attention.

It has always appeared to me that the large building with many inmates is our simplest problem, since the means applied may be mechanical, and caretakers may be provided to supervise such. But I think it will be common experience when I say that the idea of introducing adequate air while installing our heating apparatus has hitherto been given relatively little thought.

Take the heating of a school or church, for instance, and we have hot air furnaces, steam and hot water to choose from. Suppose it to be a hot air furnace which is chosen. Air is introduced into a schoolroom at from 100 to 150 degrees F. at a single point, with its moisture reduced by expansion of the air to perhaps 10 per cent. or less of relative humidity. It is delivered at one point, often creating a draft, and a chimney register of a few square inches is usually the only exit. Analysis shows the carbonic acid relatively in excess. Windows, if open, again subject the inmates to the danger from draft and so are only occasionally opened. If the heating be steam we have heat alternately in excess and defect, while the likelihood of getting a fair amount of moisture into the room and a fair degree of purity is seemingly very slight. In the case of hot water heating we have in the regulation of the degree of heat in the rooms many advantages, but in the matter of air purity the same problem of how to maintain a reasonable purity of air is quite as prominent as in the case of steam. In both cases it is not uncommon to have fire places in rooms, and in such instances a fair degree of purity is naturally maintained by the chimney shaft, greatly increased, of course, if a fire is kept in the grate, although the air near the floor is relatively cold in consequence of the draft from beneath doors leading to cold halls and the outer atmosphere.

A PURER ATMOSPHERE ATTAINABLE.

The question, therefore, before us is: Can we, with the ordinary means at our command, improve the air conditions in the living rooms of public or private dwellings without an increased expense? I believe that we can, and I propose to deal with some of the methods and explain the reasons for my opinion.

Suppose that we have to deal with an ordinary school building. What methods should we pursue to effect the desired end? I shall assume that the walls have been made in a large degree non-conducting. In a school building of four rooms, each providing for 50 pupils, and giving 240 cubic feet, or 4 x 4 x 15 feet to each, it is

* Paper read by Dr G. H. Bryce at the convention of the Ontario Association of Architects

found that 2000 cubic feet per pupil per hour will keep the carbonic acid at six parts per 10,000. In order to supply this, 100,000 cubic feet of air per hour must pass into each room whose cubic capacity is 12,000 feet. This means eight and one-third changes per hour. To supply this an inlet shaft 2 x 2½ feet is required, which delivers air at 694 feet per second. It is found that air coming into the room at this rate at a point above the head, say, 7 feet from the floor, with the mouth of the delivery duct at an angle of 45 degrees, will cause the air to distribute rapidly laterally, while the *vis à tergo*, or head, and the temperature at, say, 80 degrees F., will cause the air to rise and be propelled across the room, where, reaching outer walls, it will be cooled and descend and return at a rate not exceeding 2 feet per second along the floor toward an exit shaft, which should be at the floor near the inlet. To favor even distribution the windows should be double and the walls nonconducting as far as practicable. In order that this work be done the air must be previously warmed in the cold air room of the basement, and forced into the shaft by a fan or drawn in by heated extract shaft.

THE NEED OF MOISTURE IN THE AIR SUPPLIED.

The method provides a very important means of supplying outer air as it is warmed, with an opportunity of receiving moisture in the cold air room from broad and shallow evaporating pans supplied with water automatically by a ball float and valve. To illustrate the importance of this point some figures may be given. It will be remembered that as air expands with heat its capacity for moisture increases. The percentages of moisture at different temperatures have been calculated. Thus at

Degrees.	Per cent.
0 Fahrenheit.....	Moisture 0.09
32 Fahrenheit.....	Moisture 0.37
42 Fahrenheit.....	Moisture 0.56
52 Fahrenheit.....	Moisture 0.81
62 Fahrenheit.....	Moisture 1.17
72 Fahrenheit.....	Moisture 1.68
82 Fahrenheit.....	Moisture 2.36
92 Fahrenheit.....	Moisture 3.28
102 Fahrenheit.....	Moisture 4.54

Thus the relative humidity of air more than doubles with every 20 degrees, proportionately increasing with increasing temperature. Now, it will be further noted that air in motion practically never becomes saturated as it passes over moist surfaces, but takes up probably 75 per cent. of saturation. Hence, outer air at 0 degree going into a room, we shall say at 90 degrees, will at 75 per cent. of saturation have taken up ten grains of vapor, or it will hold 30 times as much moisture as that in outer air at zero. In other words, the 100,000 cubic feet of air hourly introduced into a school room should be supplied with 1,000,000 grains of water as vapor, or it would actually take up through evaporation 13 gallons of water hourly. As, however, the moisture from the breath of children yields a very notable amount of moisture, we may say 10 gallons of water ought to be provided hourly. This amount seems enormous, and would seem to actually use up heat. But the heat is never lost, it is only latent, and the service rendered by the moisture is apparent. If the air goes into the room too dry, and I am informed by Mr. Stupart of the observatory the air of the house heated by an ordinary hot air furnace has a relative humidity of not more than 25 to 35 per cent., even with a good evaporating pot, it is apparent that the air must from every available source in the school room seek its moisture. This it gets from the walls and furniture, but especially from the mucus membrane and skin of pupils. Now, assume that this 100,000 feet of dry air becomes even partially saturated, and I have found it in a school room heated with a Smead Dowd furnace at 50 per cent. of saturation, it is apparent that it will in an hour have removed a large amount of moisture from the bodies of the pupils. But to evaporate 1 pound of water requires nearly 1000 units of heat, and hence it is apparent that even if 2 pounds of water were given off by the breath and bodies of 50 pupils per hour 2000 heat units would be utilized. But very much more is lost by insensible perspiration.

THE EFFECT OF DRY AIR.

Now the practical point is this, that since the body temperature is 98.4 degrees F., it is apparent that the air of a room does not warm the body, but only prevents the loss of heat aided by clothing with too great rapidity, and as evaporation produces cold the lower the air is the more rapid the loss of heat by evaporation, and hence the constant experience that in rooms with dry air a temperature of 70 to 75 degrees is required to prevent a sensation of cold, whereas if the air held more vapor much less loss of heat would take place by evaporation and the sensation of cold at 60 degrees F. would not be as great as in the other case at 70 or 75 degrees. Indeed, we all know that in English text books a temperature of 60 degrees F. with the common fire place of that country is set down as a normal house temperature, due to the moist air constantly brought into the room by the draft. I have dwelt upon this point at some length because I am convinced that more injury is being caused by the abnormally dry atmosphere of our houses than from any other cause.

This matter of reducing the temperature of a living room further bears a very important influence upon the question of economy in heating. If we assume that outer air brought into a cold air chamber is at 15 degrees F., then it will require every hour in the school-room referred to some 10,000 heat units to raise it to 70 degrees F., or 55 degrees, or nearly 25 per cent. more fuel is required than is necessary to raise the air to 60 degrees if the heat rendered latent by evaporation be not considered. As some 35 pounds of coal per hour, with a loss of 20 per cent. by the chimney, is theoretically required to heat a room up to 70 degrees under the conditions we have assumed, it is apparent that the matter is a most important one for consideration

RADIANT HEAT.

In this connection it seems of importance to refer to the part played by radiant heat as an adjunct to room heating. All are aware of the effects of the heat from a grate, but we are not so conscious of the effects of the heat radiated from steam and hot water pipes. We speak of heat waves and are aware of how relatively different are different liquids, solids and gases in their power to absorb rays of heat, and that among gases the oxygen and nitrogen of the air are nonabsorbers of heat, whereas, as Tyndall informs us, the absorption of heat waves by water vapor is the chief agent in preventing the earth from becoming barren from the loss of heat absorbed by the earth during the day. Probably from 10 to 15 per cent. of the heat radiated from the earth is absorbed by the water vapor within 10 or 20 feet of the earth's surface. Such air, too, plays an important part in the absorption of heat in the air of a room when the air has its proper amount of moisture, while, further, the penetrating powers of the heat rays from radiators and grate fires by which the bodies of occupants are warmed are well known. Another point of importance in this connection is the fact that a white wall reflects the heat to a much greater degree than dark walls, although not absorbing heat readily itself, and the black steam pipes are much better radiators than if painted white.

We have dealt with some of the physical laws entering into the conditions affecting the heating of the air of rooms, but I have frequently thought that the construction of our houses, which usually have open stairways on three stories, might be dealt with in a much more economical manner than is usually practiced. Most of us know that in a single room, say on the ground floor, the heat near the ceiling is 10 to 15 degrees higher than at the floor, and for the same reasons the air of the lower floors constantly ascends as by a funnel to the upper rooms. In such cases the remedy applied usually is to have a hot air register or a hot water radiator in each room.

EXHAUSTING FOUL AIR.

Some of our economy hot air furnace manufacturers have, however, seized upon a familiar fact—namely, that by drawing off the air at the floor by a down draft shaft leading to the warm air chamber around the fur-

nace not only is the air led more equably in each room, but the warm air is kept near the floor of the room—and they have with much success solved the problem of equal distribution of heat and economy in the use of fuel. The fatal defect in the system is that they are reheating the air already breathed and violating the very first principles of introducing pure air by a fresh air duct in the living rooms. Now it appears to me that we may make use of the principle of maintaining an equable distribution of heat in the manner referred to, while at the same time utilizing the fresh air shaft by arranging floor ducts so as to lead the foul air from the room into the ash pit of the furnace, with a damper which will turn this foul air into the smoke flue as a check draft in mild weather.

With regard to the question of moisture, not only can a series of shallow pans in the heating chamber of a hot air furnace be supplied, but evaporating pans under each register may with advantage be utilized for still further supplying moisture to air which is abnormally dry.

But dealing with the problem as regards the most practical method of heating a private house and at the same time supplying fresh air, there would seem to be no question but that the heating with hot water most completely supplies the several requirements. In the sleeping rooms radiators may be placed, while the window is drawn down, and a draft prevented by a drawn blind fulfills every requirement. For the living rooms each should be supplied with a radiator, while fresh air would be brought into a cold air room in which a series of radiators over which shallow pans are placed with an automatic supply of water, while there will be delivered by the indirect method an ample supply of fresh warm air with adequate moisture for maintaining the air of the room at a normal humidity.

STEAM HEATING SYSTEMS.

The question of steam heating for large buildings naturally must be considered, and in the matter of economy of installation leaves little to be desired. But except as a means of heating fresh air to be supplied by ducts with a fan, it presents all the difficulties of lack of ventilation and dryness of air which have been already referred to. When thus utilized with small radiators in rooms as supplementary heating in very cold weather, it probably is the most readily applicable of all methods. But the disadvantages of heating houses by radiators are numerous, and cannot be said to be a desirable method of heating, while defective in the total absence of adequate ventilation and supply of moisture. Equability of temperature is not possible, while the cracking due to condensed steam is most undesirable. Probably the ideal method of heating such large buildings is that where steam pipes are used for heating cold air to be delivered by fans with adequate exit shafts, while the steam is carried to coils placed in tanks of water at convenient points for each suite of rooms, from which hot water pipes are carried to the coils or radiators which heat the several rooms as a supplementary means of heating. I have, however, referred to some of the many difficulties no doubt experienced by all and have touched upon some of the possible remedies. One, however, must recognize the difficulties of having remedies applied. In too many cases we have to take what is in the market, and as I witnessed last year in some specifications for school buildings, the details were left so indefinite that it seemed likely to become a question of what furnace manufacturer could satisfy a trustee that he could get enough of heat into the building, and not whether they would be ventilated when heated. It does seem very essential that at any rate in public buildings not only should there be laws defining certain necessary conditions before school buildings, &c., could be constructed, but that, as in Massachusetts, inspectors should be employed to examine the proposed methods of heating before they be installed.

WILLIAM G. SEARS & Co., Providence, R. I., have the contract for a steam heating plant in the Westminster Hotel, in that city.

Plumbing and Sanitary Appliances in Southern France.

Modern improvements are being introduced into buildings in this consular district, says Attilio Piatti, acting United States Consul at Nice, France, and I am of the opinion that the use of sanitary appliances will assume large proportions in the next few years, and that our manufacturers should seek to enter this field. The system of supplying hot water throughout houses has not yet been adopted here, but detached water heaters are largely used. A gentleman to whom I described our kitchen ranges supplying hot water would have placed them in all the apartments of a large, new building, had he been able to find them on the spot.

Considerable quantities of these goods have been imported from England; up to the present, the sales of German firms have consisted principally of brass cocks and faucets and of plain zinc baths. I am informed that the latter may be had here at about 20 francs (\$3.86) less than the French article, and of better workmanship.

The following prices are paid by plumbers for the articles mentioned:

Articles.	Prices paid by plumbers	Custom house duties per 220.46 pounds	Municipal tax per 220.46 pounds.
Water heaters, gas (of copper), each	\$36.67	\$9.60 net weight	Free.
Baths, cast iron (interior enamel), each	\$30.40 to 49.90	\$2.90 net weight*	Free.
Cabinet bowls:			
Half porcelain, colored, each	4.25 to 8.50	\$2.40 to \$5.80, ranging from plain white to colored or decorated, gross weight.	\$0.60
All porcelain (one piece):			
White, each	6.20 to 11.60		.60
Colored, each	14.50		.60
Sitz baths, all porcelain, colored, each	44.50		Free.
Lavatories, each	34.75 to 115.80		Free.
Cast iron water tanks, each	3.50 to 7.75	\$0.66 gross weight...
Copper tubes, plain, (diameter, 1 5/8 to 1 7/8 inches), per 20 3/4 inches		1.35 \$5.79 net weight,...	.60
Lead Pipe:			
Diameter, 0.78 inch upward, per 220.46 pounds	10.25	\$1.54 gross weight...	.60
Diameter, up to 0.8 inch, per 220.46 pounds..	11.60	\$1.54 gross weight, weighing over 22 pounds, rough.	.60
Brass water cocks, each..	.75	\$4.82 net; finished, \$.80 net.	.60
	.85	weighing under 22 pounds, rough	.60
	1.10	\$3.86 net; finished, \$9.65 net	.60
Toilet water cocks:			
Nickel, each	1.60 to 3.00	\$28.95 +60
Nickel, double movement, each	2.35 to 4.85	\$28.95.....	.60

NOTE.—Goods not coming direct from the United States pay an additional duty of 70 cents per 220.46 pounds.
* Same duty if enameled inside and outside.
† All nickel works pays this duty. If parts are not detachable, whole weight pays this duty.

It will be seen that nickel goods pay a very high duty, and that nondetachable parts subject the entire article to the same duty. Our manufacturers should therefore nickel only such parts as may be detached and weighed separately. It costs about 25 cents here per running foot to nickel copper tubing, such as is mentioned in the table. I have seen but one nickel copper bath here, and the price to a plumber was \$130. I have not been able to ascertain the German price for ordinary zinc baths, the few plumbers buying them apparently desiring to keep it secret. But an ordinary zinc bath, uncouth in appearance, made on the spot, will cost not less than \$20.

The high prices charged up to the present for the most elementary sanitary appliances have been the cause of the limited consumption. The general public has no conception of the beauty, lightness and durability of our manufactures in this line, and, once known, our goods should compete most successfully with all others. Manufacturers of standard lines or of specialties should find a reliable agent to handle their goods and ship them direct, thus avoiding freight charges, middlemen's profit and commissions. Where possible, a certain credit should be given. In one case a German firm gave a plumber one year's credit on a bill of brass

cocks and toilet faucets. He now purchases all this line of goods in Germany.

I have endeavored in this report to indicate on large lines the state of this trade. Should any firm require more detailed or more technical information, I shall be glad to furnish it.

PRESENTATION TO EX-PRESIDENT TIERNEY.

It has been the custom of the National Association of Master Plumbers, at the close of the term of the president, for the newly elected president to appoint a committee to procure and present to the retiring president a suitable mark of esteem in recognition of the services he has rendered. At the Kansas City convention President E. D. Hornbrook appointed James C. Conroy and Job S. Fuller of Providence, and Edward J. Hannan of Washington, D. C., a committee to attend to this pleasant duty. The meeting of the Providence Association of Master Plumbers, held in Providence, R. I., on October 3, was made the occasion for this committee to discharge their duties. The committee selected an imported watch of a celebrated make and supplemented it with a handsome solid gold chain, to which was attached an especially designed charm emblematic of the plumbers' craft.

The presentation speech was made by James C. Conroy, who was secretary of the National Association during Ex-President Tierney's administration. In his speech he referred to the untiring zeal with which Mr. Tierney discharged his duties, and to the heroic sacrifices made by him in answering the calls of his office in spite of ill health. After Mr. Tierney had made a brief and graceful speech of acceptance, he was overwhelmed by congratulations from his many friends. A letter was read from E. J. Hannan, expressing his regret at his enforced absence and adding his testimony to the high esteem in which Mr. Tierney is held by master plumbers throughout the United States.

Quarterly Meeting of the Master Plumbers' National Executive Committee.

The Executive Committee of the National Association of Master Plumbers held their quarterly meeting at the Garlock Hotel, Cleveland, Ohio, on Monday and Tuesday, October 7 and 8. The meeting was presided over by President E. D. Hornbrook of Kansas City, Mo. Among those present were Vice-President Charles Polacheck of Milwaukee, Treasurer W. E. Goodman of Milwaukee, Secretary George Kirtley of Kansas City, ex-President Patrick Tierney of Providence, R. I.; W. B. Coffee of Tacoma, Wash.; T. J. Young of Mobile, Ala.; Frank Fox, Jr., of Chattanooga, Tenn.; H. Highlands of Muncie, Ind.; George Kirkhoff of Indianapolis, Ind.; C. C. Breyer of Chicago, Ill.; Joseph A. Weldon of Pittsburgh, Pa., and E. J. Hickey of Chicago, Ill. The Executive Committee were entertained at a reception tendered by the Master Plumbers' Association of Cleveland, at which refreshments were served and speeches made by both the hosts and their guests.

Gasoline Fire Pots and Torches.

Those who use gasoline fire pots and torches, whether tinnern, cornice makers, plumbers, painters, electricians or gas fitters, will find much to interest them in Catalogue A, issued by the Clayton & Lambert Mfg. Company of Detroit, Mich. The catalogue consists of 32 pages and opens with an introduction stating that the house began to manufacture articles of this character in 1889 and have since been studying how to produce the very best goods that material and workmanship can produce, designed with a special adaptation for the needs of the mechanic. They also point out that they have been enabled to make gasoline fires to do a great variety of work safely and have made these appliances indispensable to the expert mechanic. The first seven pages of the catalogue are devoted to fire pots for heating solder coppers and melting lead in the kettle and also adapted for braziers' use. Some are so constructed that

the upper portion can be removed, allowing the flame to be used as a torch. Three pages are occupied by special fire pots for plumbers' use. One cut shows high power apparatus made especially for braziers. A great variety of hand torches, adapted for various purposes, are presented and also an alcohol torch for gas fitters and other mechanics, as well as several styles of illuminating torches, some adapted for lighting workshops and foundries, and others of small capacity for carrying in the plumbers' tool kit for use instead of the inevitable candle. The last pages are devoted to illustrations of the various parts, with instructions for using repairs, together with a complete price-list.

Sharks in the Building Trade.

BY "R."

The article in *The Metal Worker* of September 14, entitled "Unfair Conditions of Specifications," covers more ground than steam and hot water specifications. It is applicable to every department of the building trade. A scoundrel, who, by hook or by crook, has obtained a parcel of ground determines to build, and that, too, with the premeditated design of robbing either the contractors, the building and loan people, or, as a *dernier resort*, the insurance company. There being more risk in the last case than in any other, of course, that is left as the final effort. Now after he—the owner—has decided to build he directs all his energy to finding an architect, who must fulfill certain requirements. For instance (I shall hereafter designate the architect as "he"), he must be a person who has no idea of honesty and has assurance in geometrical proportion to his ignorance; one who does not understand the meaning of the words he employs, has not the slightest idea regarding the technical terms he speaks of, and cannot conceive the difference between a Kelly stop and waste and a Mueller, and actually specifies that a Mueller stop and waste is to be set as follows (I quote from the specification before me): "Where place two ¾-inch Mueller stop and wastes so as to control all fixtures and train same for hot and cold water. Handles for same to be galvanized iron fastened to wall with brass screws and to be 2½ feet above floor close to boiler." I quote this literally to show how very little this style of architect knows. This clause was written for this so-called architect by a plumber, and barring "train" for "drain," and reading "Kelly" for "Mueller," it would be all right.

Of course, after "Owner-Thief" has secured the services of "Architect-Rogue," their first endeavor is to cajole some contractor on the fly—any bird of passage will do—persuade him that half the specifications will not be exacted; get a bond, usually a lumberman or so; quarrel, either direct or through the architect; insist upon an exact fulfillment "although such things may not be particularly mentioned," and force the contractor to a compromise. Then comes the turn of the building and loan association. The greater part of the work being done, as well as the poor devil of a contractor, and the work paid for at 33 cents on the dollar actual value, then the ever present "jackleg" is called upon, who does the job, the owner, the architect and the building and loan association, and this robber of thieves makes the greatest percentage of spoils after all—except the owner, who has built to burn, and even he has to share with the complaisant architect.

Now, the architects who know their profession do not and will not recognize these short change butchers, and no reputable architect will attempt to shield himself under and at the cost of a contractor. They are paid to know, theoretically, the requirements of a good job, and will carefully take into consideration all, even the minutest details. Then, should mistakes occur, as they will, the architect will act as a just judge and not as a partisan.

Now as to the remedy. Let the architects obtain authority in the various States to debar, not the rascals, for there will always be a few of those, but the incompetent professors. For, of necessity, the latter must belong to the criminal class eventually; they cannot get

work honestly and must resort to illegal means to obtain a living. Make it as great a crime to put up a sign "Architect" as it is to put up M. D., druggist or plumber without first having proved title to the satisfaction of their peers. The shyster architect is more dangerous than the shyster lawyer or quack doctor. Wipe out your dishonest architect and you will save 50 per cent. of the fire losses, 5 per cent. of lawsuits, and save some men from conviction as firebugs. Arson is a crime that originates in the office of the dishonest, incompetent architect.

A PLUMBING EPISODE.

In almost all large plumbing shops in the leading cities there is some old and experienced plumber, or some younger and intelligent plumber, who is sent to find the cause of troubles reported at the shop. A short time since an order was left with a New York City shop to send a man to find the cause of an "infernal racket" in the plumbing pipes in a Fifth avenue residence. The distinguished owner was at home at the time the plumber arrived and was smoking his pipe in his dressing gown as the artisan was ushered in.

Just as the two arrived at the point where the sound was most distinctly heard it was repeated so as to make the pipe rattle and cause a considerable noise. The owner exclaimed "There you have it." The plumber, with equal promptness, rejoined, "The noise is caused by nothing in this house." The owner said "What?" and glared at the plumber. The latter immediately explained that the cause of the trouble was about ten blocks away, and said that he had heard several complaints in the neighborhood and would go and try to discover the cause.

This information evidently struck the owner as a piece of glaring stupidity and the plumber was allowed to depart without comment. He found, about ten blocks distant, a large apartment house in which a suction tank between the street main and the pump used to fill the tank on the roof which supplied the building had broken down, and that the engineer of the apartment house was pumping directly from the street main through a by pass. At every stroke of the pump there was a cessation of pressure in the main, which extended into every building connected with it for some distance.

He suggested to the engineer that he shut down the pump for a short time at a given hour and went back to his original customer. Inviting him to come to the point where the noise was being repeated distinctly, he told him that at a certain time the noise would cease, explaining to him the cause and what arrangements he had made. As soon as the time mentioned was reached the engineer stopped his pump and the noise in the pipes ceased.

The plumber then took his departure, standing high in the estimation of the customer, who, it may be mentioned, is one of the popular authors of the day.

An Unusual Piece of Lead Work.

Clark Brothers, 218 South Twelfth street, Philadelphia, Pa., recently completed a notable piece of lead work at the new Philadelphia Mint. It was desired to provide a lawn at the front and side of the building, but a difficulty presented itself owing to the solid concrete and stone foundations of the Mint and the sidewalk around it. To overcome the difficulty two immense lead pans were built to hold the necessary earth. These pans were 18 inches deep and covered a space of 13,000 square feet, requiring 40 tons of 6-pound sheet lead, which was furnished by Tatham Brothers of Philadelphia, for the purpose. Some of the single sheets used were 41 feet long and weighed nearly a ton. All the joints between the sheets were made by the lead burning process, so that the completed work might be one solid bed of lead. In order that the earth in these mammoth lead pans might be moistened and drained, special drain pipes were connected at suitable points for the purpose.

An Ancient English Plumbers' Guild.

The charter of the Society of Plumbers, Pewterers and Glaziers of Newcastle-on-Tyne, says an English contemporary, is dated September 1, 1536. It enjoined them to go together on the feast of Corpus Christi and maintain their play of "The Three Kings of Coleyn," to have four wardens, who were to be sworn on admission not to interfere with each other's occupation; that no Scotchman born should be taken apprentice, or suffered to work in Newcastle, on pain of forfeiting 3 shillings 4 pence, one-half of which to go to the upholding of Tyne Bridge. On September 7, 1730, it was ordered that "no brother lend his diamond, except to a free brother of this company, on pain of forfeiting 6 shillings 8 pence." Their hall, anciently called Morden Tower, was granted to them in the mayoralty of Sir Peter Riddell, A. D., 1619. A gilded ball was suspended from the ceiling of this meeting room. It is conjectured that it had probably been shot from the cannon of the Scottish army during the great siege of the town in 1644, and, having lodged in the wall, was discovered on the alteration of the tower.

The Bailey Patent Pipe Couplings.

Owing to the ease with which a permanent joint can be made in connecting two pieces of lead pipe, or a lead pipe with iron pipe, by means of a special coupling, this method of connecting pipe has greatly increased in popularity. In the accompanying illustrations are shown

Fig. 1.—Coupling for Lead Pipe.

Fig. 2.—Coupling for Iron and Lead Pipe.

The Bailey Patent Pipe Couplings.

Bailey's patent lead pipe coupling and connections, manufactured by the J. & E. Stevens Company, Cromwell, Conn. Fig. 1 shows the coupling used for connecting lead pipes or other pipes of soft metal. The couplings are made for five different weights of lead pipe, from D to AA, and for all sizes of pipe from $\frac{3}{8}$ to $1\frac{1}{2}$ inches in diameter. In the sectional view it will be seen that the coupling consists of four parts. The ring B is threaded on the inside, to be screwed on to the end of the lead pipe. The nut C is screwed on to the end of the other piece of pipe. The expanding packing ring D is inserted in the end of these pipes after they have been slightly opened with any taper tool. The pipe connection is made by screwing up the shell A so as to draw the two ends of the pipe tightly together.

Fig. 2 is a sectional view of the coupling used for connecting soft metal pipes to iron pipes. The nut C in this instance is threaded to receive the iron pipe, and the tapering packing ring is made as a part of it. The ring and shell are exactly the same as when used in a lead to lead pipe connection. It is pointed out that in using this coupling no special tools are required, that an ordinary wrench is all that is necessary for making a tight connection, and the joint under test has shown that it will stand a greater pressure than the lead pipe itself. Another convenient feature which may be mentioned is that in case of stoppage in the pipe it is a simple matter to disconnect the coupling and then the pipe is accessible for the insertion of a rod or connection with a force pump. It is said that these couplings have stood a pressure of over 1400 pounds per square inch.

The couplings are also made of suitable size for tin lined lead and block tin pipe.

The company issue a ten-page catalogue showing in addition to the couplings fittings for connecting sink faucets and plugs for stopping the end of pipes. Full detailed explanations, with sizes and prices are given in the catalogue, which can be secured on application. The couplings will be found convenient for waterback connections and for connecting the water supply to heating apparatus.

Death of Dent Yates.

The plumbing trade throughout the United States will learn with regret of the death of Dent Yates, who was well known throughout the trade, not only for his humorous qualities but also for his warm hearted generosity and friendship. Mr. Yates died at his home, 3607 Central street, Kansas City, Mo., on October 9, from the effects of an operation for appendicitis. Mr. Yates was born in Lexington, Ky., in 1860, his parents being of English birth. After receiving a normal school education, Mr. Bates learned the plumbing trade. After completing his apprenticeship, having considerable talent for music, he spent three years on the operatic stage. In 1881, owing to an illness which impaired his voice, he returned to the plumbing trade. After working in a number of different cities for several years and gaining varied experience, Mr. Yates formed a partnership with James Hammick in Kansas City in 1891. Mr. Yates succeeded the firm after the first year. He was very popular in his adopted city and was a delightful entertainer, having the ability to sing many popular songs with good effect. In addition to a marked gift as a writer on trade subjects, he had considerable talent for writing songs. He was a member of St. Paul's Episcopal Church of Kansas City. Mr. Yates is survived by a wife and three children.

Freezing Out Bacteria.

Hitherto experience has tended to show that, except possibly by the employment of liquid air, bacteria do not lose their vitality in the severest possible cold, says *Fire and Water*, and that ice cut from a sewage infected river, or otherwise polluted lake or pond, was simply a lurking place for typhoid fever and kindred diseases. The Boston Board of Health, however, has relegated this theory to the limbo of extinct superstitions, and holds itself prepared to show that there is little danger from the use of such ice. These savants tell us that in ice frozen by natural means the bacteria are thrown out by the process of freezing, while in the case of artificial ice sterilization proves fatal to them. In the report recently published by Dr. H. Winslow Hill, director of the bacteriological laboratory of the Boston Board of Health, we read as follows:

If ice is formed by the ordinary process of freezing downward toward the bottom, the mere act of freezing itself results in a diminution, by physically throwing out the bacteria to the extent of 90 per cent., the remaining 10 per cent. being reduced in proportion to the contamination already given, and in two weeks the percentage remaining in the ice, as compared with the number in the water originally, would give nearly the same purification as that of filtered water. In three weeks the purification would be much greater. This shows that ice more than three weeks old is as sanitariously safe as a well filtered water supply.

That statement is dogmatic enough. Dr. Hill, however, is evidently not quite certain as to the exact truth of his dogma, and by adding a warning to the ice consumer, simply retreats from the position he has laid down as unassailable. That warning is conveyed in the following terms:

Notwithstanding all the factors of safety inherent in the ice itself, there can be no question that the safety is not absolute. It is possible for ice to convey typhoid fever, if it should be polluted with typhoid discharges. A water supply must, therefore, be infected within, at most, a month previous to the formation of ice in order that the ice then formed may contain any living organism.

But that gives away the whole case, so far, at least, as naturally frozen water is concerned, and leaves the matter still in doubt. It would, therefore, seem the safer plan to stick to the good old way of refusing to purchase any ice for domestic purposes which is not guaranteed to come from an unpolluted source. The condition which confronts us is the existence of both the possibility and the probability that freezing does not kill bacteria, and that ice taken from a polluted source has frequently been known to cause typhoid fever—so frequently, indeed, as to militate very strongly against the Bostonian theory. In the case of artificial ice, it may be different—must be, if the water so frozen is distilled before being subjected to the freezing process, or if it has been carefully purified by a process of filtration scientifically conducted. If there is any doubt about the latter, then similar caution must be used as to the purchase of any ice that does not come up to the requisite conditions of purity of source.

EDUCATION FOR PLUMBERS.

BY A PRACTITIONER.

The subject of educating plumbers along the line of the cost of doing business is one which I should like to see discussed in your columns. We have a large number of journeymen plumbers in our town, who have a kit of tools and keep what little stock they have in some cellar, and do "curb stone" plumbing. They do not keep their cellars open for the convenience of those who want to have jobbing done, so are under little expense. They are satisfied with day's wages in return for their work. This class of plumbers often fail to pay their material bills, and eventually drop out, only to be replaced by others of the same class. A plumber who conducts a respectable shop, with some one always in attendance, who keeps a horse and wagon, &c., cannot compete in prices with "curb stone" plumbers.

They also contract for cheap work, like flats for workmen. If they get a job for two or three blocks of this class of flats, they get the owner to guarantee the bills for material. Some supply houses cater to this class of trade. For such jobs they will buy a larger quantity of iron and lead pipe and cheap closet fixtures in a year than we will, and consequently buy it cheaper. They will work themselves, and hire two or three men to help them.

Plumbers in our position cannot work on a job themselves, but are obliged to devote their time to superintending jobs, and have to make enough out of their profits to support themselves and their shops. The plumbers who carry their offices in their hats or in their vest pockets are a menace to the man who conducts business in a businesslike way, because they need to be educated as to the expense of doing business. When we are figuring very closely, we add 10 per cent. to the cost of material, which we calculate will cover contingencies, and consider that it will represent the net cost of the job. If we expect to make a fair living profit on a job we add 25 per cent. to the cost of material.

We find the jobbing part of our business is the most profitable, and push that end of it rather than contract work, which we do not solicit. Our gross receipts are about equally divided between jobbing and contract work.

TIMOTHY McEVoy & SON, Buffalo, N. Y., have received from the Supreme Court a judgment for \$7,925.62 against the Pan-American Exposition Company for plumbing work. The judgment covers balances due on five bills the firm had against the company and the costs of the suit. One of the bills was \$5977 for plumbing materials sold and work performed. A second was for installing a steam heating plant in the greenhouse of the Horticulture Building; a third was for piping, fittings and fountain jets for the electric fountain in North Bay; a fourth for piping and fittings for the exhibits, boiler and power plant, and the fifth for heating apparatus in the office of the superintendent of the exposition grounds.

Official List of "Accredited Manufacturers of Plumbers' Brass Work."

Under date of October 12 the Manufacturers' Association of Brass and Iron, Steam, Gas and Water Work issued to the jobbing trade through their secretary, Wm. T. Doyle, a circular-letter, asking them to adopt a line of legislation furthering a "spirit of harmony" that should actuate all who are workers in the task of bettering trade conditions. Believing in the solidarity of interests of manufacturer and jobber, the association have acceded to such requests as have been made by the adoption of proper legislation, and have issued an official list of "Accredited Manufacturers of Plumbers' Brass Work." They promise the jobbers their friendly interest, and ask them to co-operate for the mutual benefit of all. Following is the list:

The Peck Bros. Company, New Haven, Conn.
 Peck Bros. Company and L. Wolff Mfg. Company, Chicago, Ill.
 H. Mueller Mfg. Company, Decatur, Ill.
 Edwardsville Brass Company, Edwardsville, Ill.
 Kinsey & Mahler Company, Peoria, Ill.
 P. Healy, Evansville, Ind.
 A. Y. McDonald & Morrison Mfg. Company, Dubuque, Iowa.
 Ahrens & Ott Mfg. Company, Louisville, Ky.
 Henry McShane & Co. and J. Registers' Sons Company, Baltimore, Md.
 Walworth Mfg. Company, Boston, Mass.
 Haydenville Company, Haydenville, Mass.
 Detroit Sanitary Supply Company and the McKee & Roberts Company, Detroit, Mich.
 National Brass & Metal Company, Minneapolis, Minn.
 Union Brass & Metal Company, St. Paul, Minn.
 Exeter Brass Works, Exeter, N. H.
 McNab & Harlin Mfg. Company, Paterson, N. J.
 Reid Brass Mfg. Company, Brooklyn, N. Y.
 The Eaton, Cole & Burnham Company, the Kelly & Jones Company, Mayor, Lane Company, and McNab & Harlin Mfg. Company, New York City.
 The Wm. Powell Company and the Queen City Brass & Iron Works, Cincinnati, Ohio.
 Cleveland Bronze & Brass Works, Glauber Brass Mfg. Company and the Ohio Brass & Iron Mfg. Company, Cleveland, Ohio.
 Columbus Brass Company, Columbus, Ohio.
 The Humphries Mfg. Company, Mansfield, Ohio.
 J. B. Campbell Brass Works and Hays Mfg. Company, Erie, Pa.
 Haines, Jones & Cadbury Company, H. Belfield & Co., Thomas Devlin & Co., Stanley G. Flagg & Co., and Charles Perkes, Philadelphia, Pa.
 Bailey-Farrell Mfg. Company, the Kelly & Jones Company, Standard Sanitary Mfg. Company, and the Oil Well Supply Company, Pittsburgh, Pa.
 Hoffman & Billings Mfg. Company, Milwaukee Brass Mfg. Company and Rundle-Spence Mfg. Company, Milwaukee, Wis.

New York City Notes.

The Greater New York Association, after its regular meeting last Monday afternoon at Stapleton, Borough of Richmond, resolved itself into a bowling tournament, wherein the Brooklyn branch covered itself with glory, defeating the teams from Manhattan, Richmond and Queens by large scores.

* * *

The Broux branch of the association has got itself established, and is in good working order. Additions to its membership are made at every meeting. The officers elected are: M. J. McDermott, president; Peter Schweeckert, vice-president; John V. McEvily, secretary; W. D. Clark, treasurer; D. L. Delaney, financial secretary; Otto J. Spahn, sergeant-at-arms. Applications for membership will be received by the secretary at his shop on Tremont and Arthur avenues.

* * *

The journeymen are still at odds among themselves, and the parent organization has taken a decisive stand by ordering its men out of shops where members of the other faction are also employed. Owing to the present scarcity of men this has caused some inconvenience, but it will possibly lead to a settlement of the trouble.

* * *

Many complaints are still being made about the delay in the inspection of the lines by the Building Department, especially in jobs where the plasterer is following on the heels of the plumber. Another cause of complaint is that the horizontal and vertical lines are

required to be tested at the same time, and this is frequently an impossibility, as often the cellar lines are put in and covered before the building is ready for vertical lines at all.

PROCEEDINGS OF THE PLUMBERS' NATIONAL CONVENTION.

The members of the National Association of Master Plumbers throughout the United States have received from President E. D. Hornbrook at the National headquarters, at Kansas City, Mo., the proceedings of the National convention, held in that city last June. The publication, consisting of 155 pages, is well printed on good paper and neatly bound in a paper cover of brown bearing the seal of the association in three colors. On the first two pages are portraits of the National officers and the Executive Committee. Interspersed through the proceedings are full page half-tone engravings of all the past presidents of the association in their chronological order. An appendix contains the constitution and by-laws, the action of the National Association relating to duty of associations and members, revised New York conference resolutions, explanation of resolutions by President Tierney, reasons for membership and a *résumé* of the conventions of the association. A page devoted to a description of the entertainment shows a picture of the silver ladle given to ex-President Tierney by the Kansas City plumbers. The statement is made that the next convention of the association will be held at Atlantic City, N. J. The book has a well arranged index.

The Ideal Fitter.

The American Radiator Company, Chicago, have just issued a revised edition of their publication entitled "The Ideal Fitter," which is designed as a hand book and is of convenient size to enable it to be easily carried in the pocket. It is a volume of 80 pages and contains illustrations and price-lists of the Ideal line of steam and water boilers, as well as illustrations and price-lists of steel storage tanks, expansion tanks, pipe coverings, valve and fittings, floor and ceiling plates, pipe hangers, registers and ventilators and other supplies. It also contains a complete code for use in ordering by telegraph. The special value of this book lies in its use in connection with the company's boiler catalogue. The boiler catalogue gives illustrations and full descriptions of the Ideal line of boilers, but contains no prices, thus enabling it to be freely used by fitters in giving information to their customers and enabling selections of boilers to be made with more satisfaction. The Ideal Fitter, being carried in the pocket, is thus always at hand for consultation relative to prices.

The P. and S. S. League.

On Monday night the bowlers of the Plumbing and Steam Supply League of New York City gathered at the alleys at Twenty-sixth street and Sixth avenue, and when the roar of battle was over the team of the Crane Company were found victors with two games won. The honor of the high team score of 728 went to the F. N. Du Bois & Co. team, which won and lost a game. Secretary Wilson of the defeated salesmen team won the honor of high individual score with 194.

On Thursday night the "family team" of Behrer & Co. scooped all the honors. They won both of their games, made the high team score of 828, and M. Behrer the high individual score of 198. The F. N. Du Bois & Co. team won and lost a game, while the Dimock & Fink Company had two waterloos.

JAMES HERMAN EUSTIS, who was well known to the trade in all parts of New England, died on Saturday, October 12, of typhoid fever, after an illness of two weeks, at his home in Chelsea, Mass. Mr. Eustis was connected with the Walworth Mfg. Company of Boston for 18 years and had the confidence and respect of his employers and all of his associates. He was 38 years of age, and leaves a widow and a six year old son. The funeral services were held on Monday.

Heating and Plumbing Notes.

L. B. SHERMAN, with office in the Park Row Building, New York City, is the New York representative of the Niagara Radiator Company of Buffalo, N. Y.

WILLIAM HARRIS, a plumber and stove dealer of Mansfield, Ohio, has sold to the Westinghouse Company a patent for a device for connecting steam pipes.

A FIRE doing a slight damage to the plumbing establishment of Fladd & Bay, 212 North Clinton avenue, Rochester, N. Y., occurred last week.

THOMSON BROTHERS, Philadelphia, bid \$1638 and secured the contract for the steam heating plant in the Twentieth and Fitzwater street police station in that city.

H. O. CANFIELD, who is well known to the plumbing trade, owing to the variety of Rubber Goods in Washers, Fuller Balls and other Plumbing Specialties which he manufactures, has recently purchased a tract of land on Wood avenue, Bridgeport, Conn., and is preparing for the erection of a new manufacturing plant.

THE BUCKINGHAM-ROUTH COMPANY, New Haven, Conn., are installing an Ideal Boiler in the residence of H. T. Moulton, in Whitneyville.

H. L. NORTON, Springfield, Mass., is designing a system of water works for Russell, Mass., bids for the construction of which will soon be called for.

STEELE & ROSE, Newport, R. I., have the contract for plumbing the New United States Naval Hospital at Coaster's Harbor Island, and are installing new plumbing and bathrooms in the United States Contagious Hospital at Newport. They have also secured the contract for plumbing in the extensive repair shops of the New York, New Haven & Hartford Railroad Company.

THE AMERICAN PLUMBING COMPANY of Providence, R. I., have the contract for plumbing the new Brown University Administration Building.

PLUMBING INSPECTOR BLANCHARD of Kansas City, Mo., has recommended some changes in the exhaustive ordinance governing plumbing and drainage, prepared by Henry Sieben, when he was plumbing inspector of that city. One recommendation is to take the plumbing from under the jurisdiction of the Superintendent of Buildings and place it under the supervision of the Board of Health. The Inspector of Sewers is now working in conjunction with the Street Department, and it is recommended that he be placed under the jurisdiction of the plumbing department.

AUGUST GEIGER, Philadelphia, Pa., is installing a \$3450 hot water heating system in the St. Vincent Orphan Asylum at Tacony, Pa.

THE CARLTON HARDWARE COMPANY, Calumet, Mich., have the contract for the heating and plumbing of the new Larium Bank Building in that city.

C. H. BURDICK & SONS, Newport, R. I., have the contract for extensive improvements and alterations in the residence of Mrs. Hanson, including metal ceilings, electric lighting, plumbing and heating.

FRANK T. BASSETT of the Boston office of the American Radiator Company of Chicago, was a visitor in New York this week.

ROBINS, GAMWELL & Co. have the contract for a complete steam heating plant in the old and new portion of the Mills Building, erected in Pittsfield, Mass.

A FIRE recently visited the plumbing establishment of the Kennedy Company, at Cleveland, Ohio, doing damage to the extent of \$5000, which was covered by insurance.

TRAFTON & MUIRHEAD of Pawtucket, R. I., have secured a plumbing shop near the business center of that city.

A. H. FOWLER of the Fowler & Wolfe Mfg. Company, Bourse Building, Philadelphia, Pa., was one of the out of town visitors to the heating trade in New York this week. Mr. Fowler left with his friends a 12-page catalogue devoted to his company's special construction of Wall Radiators, half-tone engravings showing the great variety of sizes and shapes in which the sections can be

arranged, under windows, under stairs and on the side walls of buildings. One page is devoted to cuts of 24 different styles of brackets and supports for these Radiators. The catalogue gives complete dimensions of the different sizes of sections made and a list of buildings in which they have been used. It is accompanied by a little slip giving the data of a test for efficiency as compared with pipe coils, made by a German Government engineer, for both steam and hot water, showing a greater efficiency of about 30 per cent. for the Fowler & Wolfe Wall Radiators.

JOHN C. F. TRACHSEL, heating and ventilating contractor, Philadelphia, Pa., has taken out city permits for the installation of the following heating plants: At 1431 Norris street, a steam heating plant will be put in at a cost of \$500, and vapor heating plants will be put into 3308, 3316 and 3318 Arch street, at an aggregate cost of \$2679.

THE CRANE COMPANY, Chicago, having found their old quarters on Douglas street, Omaha, too small to meet the requirements of their growing trade in that section, have purchased a piece of ground, 110 x 132 feet, at the corner of Tenth and Harney streets, on which they contemplate the erection of a building for their special purposes. It is expected that the construction of this building will begin early during the coming spring. It will be built of brick, stone and steel. The Omaha branch is a very important house among the company's chain of branches. At every point where they have branch houses they carry a very complete stock of their Valves, Fittings and other specialties from which they are able to make immediate shipments to buyers in the locality which they are designed to serve.

THE L. WOLFF MFG. COMPANY, Chicago, are erecting two additional stories on their large building at the corner of Jefferson and Lake streets. This is the building in which the company's general offices are located. It is, however, mainly used for manufacturing purposes. The two new stories will provide them with much additional floor space, as the building is 150 x 150 feet. The space was badly needed by some of the departments which have been seriously hampered in taking care of their greatly increased business. Among these departments is the shipping department, which is one of the most important details of a manufacturing business, and needs ample room.

ALBERT H. RICKER, Cambridge, Mass., has had a number of important jobs on his hands of late. He has just completed the work of plumbing, throughout, W. W. Vaughan's house in Boston, and the house of Mrs. Whittemore in Brookline. At the present time he is installing a steam heating system in E. W. Wheeler's printing establishment in Boston. The work of putting a new heating apparatus into the Riverside School has been completed by him, and he is now at work plumbing the Riverside Mission.

THE plumbers' strike at Spokane, Wash., has been settled.

J. B. CARROLL, 36 La Salle street, Chicago, is sending out a circular, illustrated in colors, referring to the Hahn Acetylene Gas Burner. This circular gives a number of points of superiority possessed by this Burner, which have made it popular with the trade.

S. C. EDMUNDS & Co., manufacturers of Valves, Valve Cups, &c., Montpelier, Ind., are building a new plant to provide better facilities for the manufacture of their specialties. They are constructing a two-story frame machine shop, 28 x 50 feet, and a one-story brick foundry, 24 x 30 feet. The firm started some time since in a very small building on an extremely limited scale, and have been quite successful in their efforts to develop a business.

THE GADSDEN PIPE & FOUNDRY COMPANY, Gadsden, Ala., have organized with a capital of \$50,000, for the purpose of manufacturing Soil Pipe. Work has been started on the plant and they expect to have it completed and in operation in January. W. S. Fletcher is president of the company.

New Firms and Changes.

THE HOUGH MFG. COMPANY, with a capital stock of \$50,000, have been incorporated to operate a plant at Franklin, Pa., for the manufacture of Brass Specialties, such as Oil Well Supplies, Fittings for Railway Steam Engines and similar Brass Goods.

ALEXANDER THOMSON has purchased the plumbing, steam and hot water heating business of D. L. Hughes, at Summit, N. J. Mr. Thompson has been in the employ of the firm of Milne & Platt of Orange for the past 14 years.

THE FLETCHER MFG. COMPANY, to manufacture and deal in Metal Goods, have been incorporated at Enfield, Conn., by O. S. Greenleaf and M. Lyman, Jr., of Springfield, and E. O. Gibbs of Westfield. The capital stock is \$20,000, of which \$2100 is paid in in cash and \$2500 is represented in property.

A. O. GANGAWERE has purchased the business and stock of the East McKeesport Plumbing Company, at East McKeesport, Pa.

JOHN P. CRONAN, who has been for years manager for H. H. Guernsey of Church street, New Haven, Conn., has purchased the good will and stock of his employer, and will continue the business at the same location. Mr. Cronan thoroughly understands the plumbing and stove business, and he will endeavor to give the satisfaction which has made the store a popular establishment with the community.

THE L. O. HOWELL COMPANY, Philadelphia, Pa., have opened a branch of their plumbing business at 313 South Front street, Wilmington, Del.

Trade Publication.

PLUMBERS' MANUAL AND TEXT-BOOK. By F. W. Tower, Springfield, Mass. Price, \$1. Size $3\frac{3}{4}$ x $5\frac{1}{2}$ inches, 242 pages.

Since various States and cities have adopted regulations requiring plumbers to pass an examination before being granted a license, many tradesmen desire to study up probable questions before taking the examination. In this book the author has given careful consideration to this need. The work is divided into three parts—viz., water and its distribution, wastes and drainage and ventilation, together with a miscellaneous dictionary for plumbers, and the whole work lends itself readily to supplying answers for all the questions that are of interest to the plumber. Under the first topic, friction, air locks, water hammer, service pipes, wells, pumps, rams, filters, range boilers, tanks and metals are treated. Under the second topic, ventilation, drainage, sinks, grease traps, traps, siphonage and house fixtures are considered in detail. The question and answer section of the book is also divided under heads so that information on any subject can be readily found.

TRADE NOTES.

THE AMERICAN FOUNDRY & MACHINE COMPANY of 4 Trinity street, Montclair, N. J., have been incorporated with a capital stock of \$25,000 by John A. Neville, Richard B. Baker and John H. Winans, to manufacture Foundry Facings and Supplies, &c.

THE ALABAMA MFG. COMPANY are making preparations for the erection of an Iron Hollow Ware plant, at Birmingham, Ala., at a cost of \$50,000.

THE STANDARD STAMPING COMPANY, St. Louis, Mo., are completing an extensive addition to their plant.

DIXON'S Graphite Preparations for Steam, Gas and Electric Automobiles form the subject matter of a pamphlet that is being distributed through the mails by the Joseph Dixon Crucible Company of Jersey City, N. J.

THE ORANGE GRAPHITE & MICA MINING COMPANY of New York City have been incorporated with a capital stock of \$100,000 by J. C. Franke, D. F. Toumey and P. A. Crostic of New York.

AWARDS AT THE PAN-AMERICAN EXPOSITION.

Official announcement was made last week of the recompenses adjudged to exhibitors at the Pan-American Exposition as determined by the various juries of award. The juries examined and reported on some 7000 exhibits. They awarded 4577 recompenses in all. Of these 2296 were given to exhibitors of the United States, 600 to Mexican exhibits, 419 to Chilean and the balance to representatives of other Central and South American countries and the West Indies. There were awarded 887 diplomas of gold medals, 1159 diplomas of silver medals, 1147 diplomas of bronze medals and 1384 diplomas of honorable mention.

From among the awards to manufactures of the United States we print the following:

MACHINERY SECTION.**Gold Medals.****MACHINE TOOLS.**

Ferracute Machine Company, Bridgeton, N. J., stamping machinery.

Long & Allstatter Company, Hamilton, Ohio, power punching and shearing machine.

ENGINES, BOILERS AND PUMPS.

Buffalo Forge Company, Buffalo, steam engines.

MISCELLANEOUS MACHINERY, ETC.

American Steam Gauge & Valve Mfg. Company, Boston, steam gauges and engine fittings.

Buffalo Forge Company, Buffalo, blowers and fans.

Carborundum Company, Niagara Falls, N. Y., carborundum.

Jenkins Brothers, New York City, steam and water valves.

Jenkins Brothers, New York City, Jenkins' '96 sheet packing.

Lunkenheimer Company, Cincinnati, Ohio, valves, lubricators and engine fittings.

Lamb & Ritchie, Cambridgeport, Mass., lined pipe.

National Meter Company, New York City, water meters.

National Tube Company, Pittsburgh, Pa., tubes and pipes.

Pittsburgh Meter Company, E. Pittsburgh, Pa., water and gas meters.

Powers Regulator Company, Chicago, automatic temperature controlling apparatus.

Rider-Ericsson Engine Company, New York City, Ericsson engine.

L. S. Starrett Company, Athol, Mass., mechanical tools.

H. B. Smith Machine Company, Smithville, N. J., general wood working machinery.

O. C. White Company, Worcester, Mass., appliances for shop lighting.

Western Tube Company, Kewanee, Ill., valves and cocks.

Henry R. Worthington, Brooklyn, N. Y., jet condenser.

Walworth Mfg. Company, Boston, Mass., valves, fittings and tools.

Silver Medals.**MACHINE TOOLS.**

E. W. Bliss Company, Brooklyn, N. Y., sheet metal stamping and drawing machines.

Norton Emery Wheel Company, Worcester, Mass., Bath machine indicators.

Niagara Machine & Tool Company, Buffalo, N. Y., sheet metal tools.

ENGINES, BOILERS AND PUMPS.

Kleley & Mueller, New York City, steam specialties.

MISCELLANEOUS MACHINERY, ETC.

American Blower Company, Detroit, Mich., fans and blowers.

S. R. Dresser, Bradford, Pa., pipe couplings.

Eddy Valve Company, Waterford, N. Y., gate valves.

Eddy Valve Company, Waterford, N. Y., Eddy fire hydrant.

Field Force Pump Company, Lockport, N. Y., spraying machinery.

Fairbanks Company, Buffalo, steam valves.

Jenkins Brothers, New York City, Jenkins' pump valves and disk.

Wm. Powell Company, Cincinnati, Ohio, oil cups and valves.

J. H. Williams Company, Brooklyn, N. Y., drop forged wrenches and chain pipe wrenches.

Western Tube Company, Kewanee, Ill., structural tubing.

Bronze Medals.**MISCELLANEOUS MACHINERY, ETC.**

Atlas Pipe Wrench Company, New York and San Francisco, Atlas pipe wrenches.

Atlas Pipe Wrench Company, New York and San Francisco, tube cleaners for water tube boilers.

Bashlin & Co., Warren, Pa., valves and oil cups.

Buffalo Meter Company, Buffalo, water meters.

A. A. Griffing Iron Company, New York City, steam separating traps (Bundy).

Harrison Safety Boiler Works, Philadelphia, Pa., Cochrane steam and oil separator.

Harrison Safety Boiler Works, Philadelphia, Pa., drainage system for vacuum oil separator.

Robert A. Keasbey, Buffalo, magnesla covering.
 Monarch Mfg. Company, Waterbury, Conn., safety engine stop valves.
 Norton Emery Wheel Company, Worcester, Mass., bench and floor grinding machinery.
 National Pipe Bending Company, New Haven, Conn., coils of iron, brass and copper pipe.
 Trimont Mfg. Company, Roxbury, Mass., pipe tools.

ENGINES, BOILERS AND PUMPS.

Abendroth & Root Mfg. Company, New York City, improved Root water tube safety boiler.
 American Blower Company, Detroit, Mich., blower engine.

Honorable Mention.

Abendroth & Root Mfg. Company, New York City, Root's spiral riveted pipe.
 Hickman-Melhorn Company, Pittsburgh, Pa., combination vise and pipe wrench.
 Kennedy Valve Company, New York City, iron and brass valves.
 Vincent Valve Company, Sandusky, Ohio, globe and gate valves.

AGRICULTURAL IMPLEMENTS.

Gold Medals.

Coldwell Lawn Mower Company, Newburg, N. Y., lawn mowers.
 De Laval Separator Company, New York City, centrifugal cream separators.
 F. E. Myers & Bro., Ashland, Ohio, farm pumps.
 Geo. L. Squier Mfg. Company, Buffalo, sugar mills.
 Supplee Hardware Company, Philadelphia, lawn mowers.
 Vermont Farm Machine Company, Bellows Falls, Vt., U. S. cream separator, Babcock tester and Davis swing churn.

Silver Medals.

Coldwell Lawn Mower Company, Newburg, N. Y., motor mower.
 Iron Clad Mfg. Company, New York City, milk cans and dairy supplies.
 A. H. Reid, Philadelphia, Pa., cream separator and churn.
 Star Milk Cooler Company, Haddonfield, N. J., sanitary dairy apparatus.
 P. M. Sharples, Philadelphia, Pa., cream separator.

Bronze Medal.

P. M. Sharples, Westchester, Pa., cream separators and dairy and creamery appliances.

MINES AND METALLURGY.

Gold Medals.

American Steel & Wire Company, Chicago, Ill., steel and finished steel products.
 Edward G. Acheson, Niagara Falls, artificial graphite and corundum.
 Cleveland Stone Company, Cleveland, Ohio, sandstone used in architecture and grindstones.
 Norton Emery Wheel Company, Worcester, Mass., corundum wheels.
 Pike Mfg. Company, Pike Station, N. H., corundum specimens and products.

Silver Medals.

Baker & Co., Newark, N. J., platinum metals and products.
 H. W. Johns Mfg. Company, New York City, exhibit showing evolution of asbestos.

ELECTRICAL DIVISION.

Gold Medal.

Pittsburgh Reduction Company, Niagara Falls, N. Y., electrical conductors of aluminum.

Silver Medal.

Eureka Tempered Copper Works, North East, Pa., tempered copper and cast copper.

Honorable Mention.

American Watchman's Time Detector Company, New York City, watchman's time detector.

TRANSPORTATION.

Silver Medals.

Consolidated Car Heating Company, Albany, N. Y., heating apparatus for steam and electric cars.
 Gold Car Heating Company, New York City, car heating apparatus.
 Safety Car Heating & Lighting Company, New York City, steam heating for railway cars.
 Twentieth Century Mfg. Company, New York City, bicycle, cab and automobile lamps, and special purpose hand lanterns.
 Veeder Mfg. Company, Hartford, Conn., cyclometers, odometers, counters and fine castings.

Bronze Medal.

Noera Mfg. Company, Waterbury, Conn., steel and brass rollers, pumps, wrenches and cyclometers.

MANUFACTURES.

Gold Medals.

American Wringer Company, New York City, clothes wringers.
 American Steel & Wire Company, New York and Chicago, wire nails and miscellaneous springs.

Bissell Carpet Sweeper Company, New York City and Grand Rapids, Mich., carpet sweepers.

Buffalo Scale Company, Buffalo, Buffalo scales.

Geo. M. Clark & Co., Chicago, gas and gasoline stoves.

Enterprise Mfg. Company of Pennsylvania, Philadelphia, food choppers, fruit presses and mills.

Iron Clad Mfg. Company, New York City, enameled and galvanized iron ware.

Michigan Stove Company, Detroit, stoves and ranges.

Pittsburgh Reduction Company, Pittsburgh, aluminum.

Isaac Emerson Palmer, Middletown, Conn., hammocks and apertures.

J. H. Williams & Co., Brooklyn, drop forgings and special designs.

Silver Medals.

Abendroth Bros., New York City, steam and hot water heaters.

Abendroth Bros., New York City, gas ranges.

Buffalo Mfg. Company, Buffalo, nicked brass and japanned wares.

E. Howard Clock Company, Boston, the Howard watchman's clock.

James Heekln & Co., Cincinnati, Ohio, Kin-Hee quick coffee pot.

Iron Clad Mfg. Company, New York City, steel storage and shipping barrels.

Iron Clad Mfg. Company, New York City, cold weld range boilers.

Jewett & Co., Buffalo, stoves and ranges.

Kelsey Furnace Company, Syracuse, N. Y., warm air generators.

L. O. Koven & Bro., New York City, hot water boiler, with coil.

MacDougal White Lead Company and Buffalo Oil, Paint & Varnish Company, Buffalo, MacDougal white lead and Buffalo oils, paints and varnishes.

Pratt & Letchworth Company, Buffalo, malleable iron and steel castings.

Pike Mfg. Company, Pike Station, N. H., sharpening and grinding stones.

Pittsburgh Reduction Company, Pittsburgh, Pa., aluminum cooking utensils.

Arthur E. Rendle, New York City, Paradigm and Duk Bac skylight.

John A. Roebling's Sons Company, Trenton, N. J., wire cloth and screens.

Wilke Mfg. Company, Anderson, Ind., refrigerators.

Wagner Mfg. Company, Sydney, Ohio, aluminum and iron hollow ware.

Bronze Medals.

George M. Clark & Co., Chicago, gas water heaters.

Cosmopolitan Range Company, New York City, electric broiler and oven, and French range.

Erie Specialty Company, Erie, Pa., cork pullers.

Iron Clad Mfg. Company, New York City, steel soda fountains.

L. O. Koven & Bro., New York City, galvanized iron range boiler.

Lorillard Refrigerator Company, New York City, refrigerators.

Edward Miller & Co., Meriden, Conn., oil lamps.

Mann Bros., Chicago, wooden ware and washing machines.

1900 Washer Company, Binghamton, N. Y., 1900 washer and washing machines.

Norton Emery Wheel Company, Worcester, Mass., India oil stones.

Purity Stopper Company, New York City, aluminum stoppers.

Roberts Mfg. Company, Philadelphia, germ proof filters.

A. L. Swett, Medina, N. Y., hot water heater.

Honorable Mention.

American Lamp & Brass Company, Trenton, N. J., lamps.

A. Buch's Sons, Elizabethtown, Pa., lawn swings.

Jenkins Brothers, New York City, electromagnetic lamp holder.

United Indurated Fibre Company, Lockport, N. Y., ice cream freezer.

Death of William Rodgers.

William Rodgers, a pioneer in the sheet and tin plate industry, and the introducer into this country of the manufacture of Russia and planished iron, died on October 7, at the City Hospital, Wheeling, W. Va., from paralysis, after an illness of two years. Mr. Rodgers was born in Wolverhampton, England, in 1827, and came to the United States when 30 years of age. He built in 1857 the Everson & Preston Works, the first sheet mills erected in Pittsburgh. Four years later he built two sheet mills at Apollo, Pa., where he made the first black plate for tinning purposes ever turned out in this country. In 1870 he built two mills at Leechburg, Pa., for the production of tin plate and sheet iron. Mr. Rodgers was sent, in 1871, by Governor Geary of Pennsylvania to Great Britain and Europe in order to investigate the metal manufactures on the other side of the Atlantic. While in Russia he discovered the secret of the manufacture of Russia iron, which he brought back to this country and put to use in the establishment of the American Russia iron industry. He was the first to use natural gas for iron making, and at one time owned patents covering its use for all purposes.

THE DONNER PROCESS OF ROLLING BLACK PLATE.

When the negotiations for the scale between the Amalgamated Association and the American Tin Plate Company were concluded the Monessen plant was excluded because a special method of rolling black plate was in operation there. An admirable description of the system in question is given in a recent issue of *Tin and Terne*, from which we reproduce the following, the system having been introduced at the Monessen works early in 1898:

The system was put in operation, and the first patent issued, before the formation of the American Tin Plate Company. W. H. Donner, the patentee, made an agreement with the company by which a thorough trial of the economies should be made, extending over a period of three years, to determine the basis of compensation. This time has now nearly expired. The patent is No. 615,535, dated December 6, 1898. There seems to be no question that the American Tin Plate Company enjoy an important advantage over competitors through the possession of the system.

In the rolling of tin plate two methods only have heretofore been used, with the separate roughing stand, and without it. With the single stand, the roughing has a greater heating effect than any of the other operations, and the result is that at the close of the roughing the rolls have been unduly heated, while the heat goes down more or less irregularly while the pairs, fours and eights are being rolled. It is difficult to keep the rolls up during the rolling of the eights. Besides this general heat change, which constitutes a complete cycle with each heat, there are minor variations owing to the "rests" which are introduced more or less irregularly in the effort to keep the rolls of the right contour. The rolls are continually seesawing above and below the average temperature. As the rolls are being puffed the outside is hotter than the inside; as they are approaching the hollow condition the outside is cooler than the inside. When the separate roughing stand is used the finishing stand remains wholly idle during the roughing, while the roughing stand is wholly idle for long periods at a time.

It is plain that if the rolls were doing absolutely uniform work their temperature would remain uniform. How is this to be done? There has been a popular superstition that the work must all be done on the same pair of rolls. In support of this position it is argued that the passes must all be of the same contour, and it is held that since there is considerable variation in the contour even with the same pair of rolls, there would be still more with different pairs of rolls. This is a wholly erroneous conclusion, because the variations in contour in the single pair of rolls are due simply to the fact that the work is done all with one pair. It matters not how many successive pairs of rolls are used, provided they are turned to suit the temperature and the temperature is kept uniform. All the passes will then be similar.

A FIVE-STAND UNIT.

The inventor argued that the ideal condition would be the passage through a given stand of rolls of packs having all the same length and temperature, the passes occurring at absolutely regular intervals. Then the rolls would remain at exactly the same temperature, so that the contour would be the same at all times and there would be no danger of breakage from differences of temperature between the inside and outside portions of the roll, and from this was evolved the new system, which attains the desired result. The simplest case involves the use of either four or five stands of rolls as a unit, five being preferable. The conditions at Monessen have been such, there being but six completed mills, that this arrangement could not be conveniently worked, and so another plan, involving the same principles, has been used, but it will be well to describe first the system as it would be practiced in case five stands of rolls constituted a unit. In this case, the first two stands will do all the roughing, on the third stand the pairs will be rolled, on the fourth the fours, and on the fifth

the eights. The roughing is divided between two pairs of rolls because the duty is so much more severe. The work is continuous with each stand, and here is the novel point which forms the basis of the patent. There will always be more than one series of bars being rolled at a time. In the usual practice the last pack of eights is done before the first pair of bars is roughed. There is but one series of bars or packs being rolled at a time. With the plan outlined there will be four series of bars or packs being worked at any given time. The basis of the patent is that there is a plurality of series of bars under treatment all the time, and in no other way can the rolls be made to receive the regular heat treatment to which reference has been made, so that they will remain always of the same contour and will not vary in temperature.

THE IDEAL OPERATION.

The operation would be as follows: A heat of bars is put into one of the two furnaces standing opposite the first two stands of rolls. When they are hot the bars are withdrawn and roughed. A few will be roughed on the first stand, then a few on the second stand, then back to the first again, so as to divide the work evenly between the two stands. When two bars have been roughed they are matched, and the pair put into the first of the pair of furnaces opposite the third stand of rolls. Meanwhile the other of the pair of furnaces opposite the two roughing stands is being charged with bars. The first operation ends with a heat of bars in one of the first pair of furnaces, ready to be roughed, while the other of the pair of furnaces is ready for the third heat of bars to be started. The first of the pair of furnaces opposite the third stand of rolls is full of pairs ready to be rolled. The next operation is to roll these pairs, putting them back, doubled, into a furnace of the next pair. During this time the second heat of bars is being roughed, and the third heat charged. The next operation is to roll the fours on the fourth stand of rolls, putting them back, doubled, into a furnace of the last pair, while at the same time the second series (in the shape of pairs) is being rolled on the third stand, and the third series (in the shape of bars) is being rolled on the first two stands, while the fourth series (the cold bars) is being charged into the furnace. The next operation, which completes the chain, is to finish the first series (in the form of eights) while the second series is being rolled and doubled into eights, the third series is being rolled and doubled into fours, the fourth series is being rolled and matched, and the fifth series is being charged into the furnace. The whole system is now in operation, and subsequent practice is simply to keep up the work in a regular and orderly manner, new heats of bars being continuously charged. Every time a new heat is charged each of the preceding heats is advanced one step. The work is kept up continuously, and each stand of rolls is always doing the same work. Each pair of rolls is turned for the exact work it is to do, and the passes are therefore all parallel at all times. In any of the pairs of furnaces, one of them will be continuously receiving cold packs while the other is supplying hot packs during the period, while in the next period their relative positions will be reversed, and so on.

A very important feature of the practice just referred to is that, as the packs are taken from the furnace and rolled, they are not put back into the same furnace, but into another furnace. In the ordinary practice the packs are put back cold into the furnace from which hot packs are being withdrawn, with the effect that portions of the hot packs are liable to be chilled, and will therefore roll irregularly. To avoid this as much as possible great skill is required on the part of the heater, which can now be done away with. Then again, each roller or catcher will always be handling either bars, pairs, fours or eights, and will acquire special skill in his one particular branch. A workman can roll eights better if he rolls nothing else. Between the third and fourth stands is stationed a doubler with his doubling shear, and another between the fourth and fifth stands. The first named will be doubling fours all the time. The second will be doubling eights all the time. Each will be a better workman, other conditions being equal.

than if he doubles fours for a while, then doubles eights, and then helps at the furnace.

THE MONESSEN METHOD.

As has been explained, the conditions have been such at Monessen that the system just described would be inconvenient, because there are but six mills entirely completed. It has been explained at such length because it shows most clearly the principle, and produces absolutely the result of maintaining at all times the same temperature in a given stand of rolls. It has been found that even a partial application of the new principle fully meets all requirements, and the six mills at Monessen have therefore been divided into three pairs, each pair constituting a unit, separate and distinct from the others. On the first mill the bars and pairs are rolled, and on the second mill the fours and eights. Thus the first stand is rolling bars and pairs alternately, and the second mill fours and eights alternately. It is found that the variation in the work is not in this case sufficient to seriously disturb the temperature or contour of the rolls. The writer has carefully inspected the working of the plant on this principle. Between the two mills is placed a doubling shear with a doubler. He is kept doubling heats of fours and eights alternately.

ADVANTAGES AND RESULTS.

The rolls being turned exactly for the work they are to do, and being kept at practically the same temperature, the ends of the finished packs are wholly without horns or rounded ends. The scrap is very materially reduced at the doubling shear and at the squaring shear. The edges of the packs are straight and even. The surface of the sheets is excellent. As the men are doing practically the same work continuously, they acquire a greater skill than is usual. But few of the men working at Monessen have had any previous experience in a tin mill. The bulk are men who have been trained to do the work, and they have made excellent workmen, as was evidenced to the writer by the excellent quality of the work turned out and the ease with which they were turning out the product, which was averaging over 14,000 pounds per turn for each double crew. The blackboard showed four turns considerably exceeding 14,000 pounds for a pair of mills, during the week, but the inventor seemed desirous of apologizing for the outputs, and it seemed evident that the men if pushed could turn out very much more, possibly as high as 20,000 pounds for a pair of mills, when rolling packs 28 x 60. It is certainly remarkable how quickly the men at Monessen have learned to do their work. They handle the tongs with the ease and confidence of veterans in the business. They are paid wages which are eminently satisfactory to them, yet the tonnage cost of their labor is considerably less than it is in other mills. Their high earnings are due mainly to the steady operation of the mills throughout the turn, by which a very large output is secured without special effort.

Only one roll has been broken at Monessen since the present run began, last February, and that roll had a defective neck. Only two coupling boxes have been broken in the past six months.

The reduction in scrap and the regularity of the doubling work at Monessen has in considerable measure been due to the use of a peculiar form of doubling shear, the invention of Frank Donner, a brother of W. H. Donner. The shear was patented some time ago. It is so similar to the ordinary doubling shear that a workman who has been accustomed to the use of the ordinary doubling shear can change to it without experiencing any feeling of awkwardness, the only difference being that the portion of the table opposite the knives is depressed $\frac{1}{2}$ inch or so below the balance of the table, forming an edge which is exactly at a right angle to the knives. In shearing off the end of the pack, the doubler shoves the pack against this edge, and the end of the pack is in consequence sheared off at an exact right angle. The presence of a guide for this work, extending above the general surface of the table, would be objectionable.

A peculiar effect of the steady and regular tempera-

ture of the rolls is seen in the behavior of the bearings of the rolls. To secure good lubrication it is of course necessary that there should be the most accurate fit between the brass and the neck of the roll. This fit will come by wear, provided the neck remains of the same shape. If the roll varies in temperature the shape of the neck will also vary. At Monessen the practice keeps the necks of the same contour continuously, and the wear of the brasses is much below the average, while the consumption of grease is reduced to less than one-half. The perfect fit between brass and neck makes the bearing run cool.

It has been found that the rolls will maintain a good surface for two weeks, and in fact seem less liable to deterioration than when used with the regular system and with the ordinary output.

The Russo Side Draft Ventilator and Automatic Damper.

In the accompanying illustrations we show a new ventilator, named the Russo, which is being put on the market by David J. Rosen, 439 Canal street, New York City. A broken view of the ventilator with the auto-

The Russo Side Draft Ventilator and Automatic Damper.—Fig. 1.—Broken View, Showing Construction and Damper Closed

matic damper in place is shown in Fig. 1, while Fig. 2 shows the automatic damper, which is presented as a new twentieth century idea in connection with ventilators. From the broken view presented in Fig. 1 it

Fig. 2.—View of Damper Open.

can be seen that the construction of the Russo ventilator is such as to induce an exhaust whenever a strong wind is blowing and to prevent a back draft under any conditions. These ventilators are said to be so constructed and finished as to present an attractive appearance, in keeping with the architecture of structures upon which

they may be used. The automatic damper is so constructed that it occupies but a small space in the ventilating tube, and, by means of a spring, it is always kept in an open position. It is provided with an eye to which a cord may be attached for pulling down the wings and closing the ventilator when this is desirable. The Russo ventilator is manufactured either with or without the automatic damper, and is adapted for use in ventilating schools, club houses, convention halls, or other public buildings. When used without the damper it is said to have a beneficial effect on smoky chimneys. The ventilator is made in a variety of sizes and is fully explained in the catalogue, which can be had on application.

The Spiral Riveted Tube Company.

There have been incorporated under the laws of New Jersey, the Spiral Riveted Tube Company, with a paid in capital of \$175,000. The principal object of the company is defined as follows: "Manufacturing and dealing in spiral riveted pipe machines, spiral riveted pipe, light and heavy sheet iron work, brass and iron castings, including the business of galvanizing in all its branches." The company are the owners of several very recently granted patents on improved machinery for manufacturing spiral riveted pipe, which will enable them to manufacture better and stronger pipe and produce it much more rapidly and with far greater economy of labor than has hitherto been done.

The factory, which will cover a little over an acre of land, will be located in Jersey City near the corner of West Side and Fisk avenues, on the Newark branch of the Central Railroad of New Jersey with a railroad siding running directly through the works. The New York office will be at 284 Pearl street. The building for the galvanizing department, now nearly completed, is 50 x 100 feet in size, and contains the largest and most modern improved galvanizing plant in this section of the country. It has two baths, each 32 inches wide, 44 inches deep and 22 feet long, holding 50 tons of metal. This department will be ready for operation November 1, and it is reported that the company have enough contracts already booked for outside work to keep it well employed for many months. Pipe machines capable of turning out pipe of all sizes from 3 to 30 inches in diameter are now building at the works of George M. Ball & Son of Brooklyn, and will be completed by the time the main building of the plant is finished and ready to receive them.

The officers of the new company are: President and treasurer, John A. Wilbur (also president of the Salem Nail Company); secretary, A. Howard Abendroth (formerly of the Abendroth & Root Mfg. Company); general superintendent, Frederick W. Stapf (formerly with the Abendroth & Root Mfg. Company).

FLASHINGS.

THE YOUNGSTOWN IRON, SHEET & TUBE COMPANY, Youngstown, Ohio, announce to the trade that they expect to have their Sheet mills in operation by January 1, 1902, and that they are prepared to enter orders for Double Refined Puddled Iron Sheets, Common Iron Sheets, and Black and Galvanized Steel Sheets for delivery during January, February, March and April, 1902. The company propose to make a specialty of Double Refined Puddled Iron Sheets.

THE PARKERSBURG IRON & STEEL COMPANY of Parkersburg, W. Va., have increased their capital stock from \$250,000 to \$500,000. The company, who have been organized for the purpose of manufacturing Sheets, have decided to operate on a larger scale than was at first intended.

GOULD BROTHERS, Bridgeport, Conn., have the contract for the Slate Roofing on the new St. Mary's Parochial School in that city.

THE MISSOURI CAN COMPANY, with principal offices at 15 Exchange Place, Jersey City, N. J., have been incorporated with a capital of \$250,000, by Dwight W.

Morrow, Nathan A. Smyth, J. J. Treacy, Harold Walker and J. C. Walker, to manufacture Tin Cans.

THE purchase by the Westinghouse interests of about 2000 tons of German Sheet Iron, recently shipped from Hamburg, was somewhat of a surprise to the trade, inasmuch as the Westinghouse Company have hitherto used the American product exclusively. The Sheets purchased abroad are of light gauges, and are used for air pump and cylinder casings. It is claimed that experience has shown the German product to be better adapted for this purpose and to wear longer than the American Sheets.

HENRY WEYAND of Waterbury, Conn., has the contract for the Tin Roofing, Conductors and Sheet Metal work on a new church building at Brewsters, N. Y.

A PARTY of 20 hardwaremen who were delegates to the National Hardware Association convention held in Cleveland, Ohio, last week, visited Canton on Saturday, traveling on a special car. They went as the guests of the Berger Mfg. Company, the Stark Rolling Mill Company, the Carnahan Tin Plate Company and the Carnahan Stamping & Can Company of Canton. The representatives of the Berger Company at the convention had a card hung up in convention hall Friday night inviting all delegates who wished to go to Canton to inspect their manufacturing plants and incidentally visit the McKinley tomb in Westlawn, all transportation expenses being paid by the Canton companies extending the invitation.

W. S. BULLARD, Bridgeport, Conn., has the contract for covering the roofs of the new building of the Malleable Iron Company in that city with Plastic Cement Roofing. He is using the same material on a new block for Dr. Damon, and on Thomas P. Taylor's new factory.

FREEMAN BROTHERS, Ithaca, N. Y., have been awarded the contract for laying 75 squares of Tin roofing on the parish hall of the Roman Catholic Society in that city. They will also furnish the gas lighting system.

WILLIAM THIELMAN of St. Cloud, Minn., has just opened a Tin shop in that city.

THE WASHINGTON CHARCOAL IRON TIN MILLS, who have a Tin Plate plant at Washington, Pa., have given an order to the Mesta Machine Company of Pittsburgh for a Mesta Pickling Machine. The fifth mill in the Tin Plate plant of this concern will be put in operation soon.

THE WELLSVILLE WORKS of the American Sheet Steel Company, at Wellsville, Ohio, which now contains six mills, will be increased to a ten-mill plant. It is possible that in the spring six more mills may be added to these works, making it a 16-mill plant.

THE members of Unity Lodge, of the National Steel Company, at New Castle, Pa., have surrendered their charter to the Amalgamated Association on account of the manner in which the late strike was conducted. The men returned to work at this plant as individuals and organized labor is not recognized by the management.

Metal Polishes.

The articles which are used to impart a brilliant polish to brass, copper, steel and other metallic surfaces, says a writer in the *Decorators' Gazette and Plumbers' Review* of London, may be divided into two classes:

1. Dry polishing powders.

2. Polishing pastes and compositions.

Polishing Powders.—Numerous substances are used as scouring or burnishing agents for metal work. Among these may be mentioned whiting, powdered rotten stone, powdered bath brick, Tripoli powder, powdered pumice stone, putty powder (oxide of tin), powdered emery, powdered oxide of iron (colcothar, crocus, rouge, &c.), calcined magnesia, bone dust, &c.

It is absolutely essential that any material which is selected as a polishing agent should be reduced to a state of impalpable fineness. The means to be adopted to secure this will, of necessity, vary in the case of different substances, and this is outside the scope of an article like the present. As a rule, the various dry materials specified above can be purchased in a condition suitable for the purpose now under consideration.

The selection of a particular polishing material will depend on the quality of the product which it is desired to prepare, and will also be influenced to a very large extent by the nature of the metallic surface on which the polish is intended to be used. Thus for a hard surface, such as steel or brass, a selected oxide of iron, or emery powder or powdered bath brick is suitable; for a softer surface, such as copper, a less gritty material will have to be used, and whiting, putty powder or some similar substance may be chosen. For plate powders, again, the materials have to be still more carefully selected, and there must be absolute fineness in the texture of the powder. Specially prepared rouge, which is a preparation of one of the softer oxides of iron containing a very small proportion of silica, or putty powder, or finely powdered bone dust, will usually find a place in powders for this purpose.

The following are typical recipes for various classes of dry polishing preparations:

1. Polishing Powder for Steel or Brass—

	Parts.
Colcothar	100
Emery flour.....	50
Rotten stone.....	50

For softer metals increase the colcothar, and decrease the other ingredients.

For brass or copper polish a small proportion of oxalic acid may be added, say 5 per cent. of the other ingredients. It must then be remembered that the mixture is poisonous.

2. Knife Polish—

	Parts.
Emery powder.....	20
Powdered bath brick.....	100
Powdered middle purple oxide of iron....	20

The proportions may be varied according to cost and cheapening material, such as brick dust, is often introduced.

3. Silver and Plate Polish—

	Parts.
Paris white.....	50
Bone dust.....	50

4. Silver and Plate Polish—

	Parts.
Calcined magnesia.....	20
Putty Powder.....	50

5. Silver and Plate Polish—

	Parts.
Calcined magnesia.....	100
Finely powdered rouge.....	20

Polishing Pastes and Compositions.—Owing to their convenience, and the absence of dust connected with their use, these materials are now extremely popular, and are used in large quantities. They consist, for the most part, of one or more of the dry powders already referred to mixed with sufficient oily or greasy matter to form a paste. There is a great scope in the selection of a suitable medium with which to mix the dry material. Tal- low, either alone or blended with one of the animal oils, is an excellent medium, as it possesses properties which render it an approved protector of metals, especially iron or steel. Crude paraffin scale (unrefined paraffin wax) also makes a good medium; so, too, does one of the thicker mineral oils solidified by the addition of a small quantity of paraffin wax. Stearine or stearic acid is used for the same purpose, but these substances are not suitable for the finer polishing pastes, as they are acid in nature. The process consists in melting the medium which has been selected and in stirring in the dry powder. The mixture is then run into the boxes in which it is sold. Small quantities of scenting substances are usually added to mask the odor of the medium.

The Indiana courts have decided after quite a long litigation, which has been hotly contested, that the Indiana weekly wage law is constitutional. This law makes it imperative for all employers of labor in the State of Indiana to pay their employees weekly. It is a regulation which will entail much expense on large manufacturing establishments employing a great force of workmen, but it appears that no exceptions could be recognized and that the law would have to be made applicable to all employers.

Oil Fuel in California.

A correspondent of the New York *Commercial*, writing from San Francisco, reports that the use of oil as fuel in California has in many ways proved quite a success. A number of concerns, large and small, are changing from coal fuel to oil. To-day in the State there are 6000 families using oil for cooking or heating, and several small manufacturers are using the same fuel for small power purposes with every satisfaction. The case is cited of H. H. Linnell of Berkeley, Cal., who a short time ago, in consequence of the high cost of coal for power purposes in his manufacturing plant, began to try California crude oil. A Larkin burner was obtained, and the furnace altered for the new fuel. The experiment is stated to have been successful from the start. The fuel bill was reduced more than one-half, and a steady and even heat was obtained. The gauge shows that the difference in heat during a day's run did not exceed 5 degrees at the most. The objection made to the use of oil as a fuel that the burners soon become clogged was overcome by a device which immediately clears the burner of any obstruction. The fuel supply is regulated in an instant and the boiler can be set to register just so many pounds of steam from early morning to late at night, needing no care from the fireman or anybody else. The oil is kept in a cement tank near the works, and is pumped into a tank on top of the building by a small pump working from the boiler. It is fed to the furnace by gravity. Bakersfield oil is used, and the average cost for the last four months was \$19.35 a month, 554 gallons of oil being used.

Mr. Linnell, from his own experience, estimates the advantages of oil fuel over coal as follows:

1. Cost. Fuel expenses two-thirds less than when coal was used.
2. Steady heat. Now possible to obtain a continuous heat, which was not possible with coal.
3. Less labor required. Saves almost the labor of one man, engaged as fireman, engineer, &c., and who was almost constantly trying to keep up a steady heat.
4. Cleanliness. No smoke, dust, dirt or ashes.
5. No danger from fires. Most of the fires in places where boilers are used come from raking out and banking fires. An oil fire is put out by turning off a cock.
6. In hot weather oil is appreciated by those who have been obliged to work about a hot furnace shovelling coal into the fires, with the thermometer at 100 degrees or more.

Pure Water.

At the recent convention of the Central States Water Works Association at Evansville, Ind., Charles E. Rowe of Dayton, Ohio, vice-president of the American Water Works Association, took part in the discussion on "Pure Water." Following is an abstract of Mr. Rowe's remarks:

The following facts should be remembered as very important. The water will run just the same in the gravel subsoil as it does with the river or creek above it. It always hunts a lower level, and it will drain toward a river or toward a creek the same as the surface water does. It is not the backwater so called—in the case of high water—that makes the wells come up. It is the water in the ground that cannot get into the river. The water in the river does not run back, or it would not be held in its bank. Nature provides for that. Water will run into a reservoir, not out, just the same as with the human bladder, if in proper position it will hold water, but reverse it, turn it inside out, and the water runs through it as it would through a sieve. In regard to the use of river water, Indianapolis is now looking for a new water supply. River water is the water they all ought to look to for their supply. It is not cool for drinking, like that furnished by such a system as Dayton has, where the water is not exposed to the air, but it is so much nicer for bathing and so much nicer for steam purposes. Its users avoid the ill effects of lime, magnesia, &c., that are in the deep well water; but they have made sewers out of the rivers. Their rivers, if not polluted, would supply the pure water that falls from the heavens and rolls down the rivers; but factories of all kinds make dumping places of those rivers, and they ought to take this matter in hand and ask their legislatures to obviate this evil.

It is objected that this use by factories of the streams destroys the fish; that is true; very few fish are left in

creeks and rivers, because the paper and woolen mills use aniline colors—a deadly poison. Nevertheless, with all these sources of pollution, it will be found that a river, after it has rolled along for 10 or 20 miles, almost neutralizes these poisons, and the water becomes sufficiently purified for use. Columbus uses almost every drop of water in the Scioto River, and it flows away on the south as black as tar; then it runs along for 15 or 20 miles and seems purified, and the next city below uses it for its water supply; and after it has been passed through that town and its sewers, it runs back into the Scioto again, down to the Ohio, and is again used for the water supply of other cities. It is, indeed, surprising how as the water runs along for 15 or 20 miles in the air and sunlight, and the constant movement purifies the water, yet there is too much of germs and bacteria still left in it, and the great evil to be encountered now is that the water supply of rivers is contaminated, oftentimes needlessly, by mills and factories. This should be prevented by suitable legislation. This evil should be disposed of in some better way.

Bicycle Emery Grinder.

The Bicycle Grindstone Company, West Thirty-fifth and Iron streets, Chicago, Ill., are offering the bicycle emery grinder shown herewith. The frame is made en-

Bicycle Emery Grinder.

tirely of properly seasoned lumber, braced in a thorough manner with wood and steel. It is provided with an adjustable cast iron seat, properly secured. The pedals are hinged to the frame by steel hinges, and the pitman rod is so connected, it is explained, that in the event of an obstacle striking beneath the pedal the rod is released to prevent damage to the gearing. The head containing the spindle and ball boxes is under cover and protected so that no dirt can interfere with the working parts. There are 20 $\frac{1}{4}$ -inch and 48 5-16-inch steel balls used in the construction of the machine, which can be speeded to from 1800 to 2500 revolutions per minute. One medium grit, 8 x 1 inch, high grade emery wheel is furnished with the grinder. The spindle is constructed so that two emery wheels can be used at the same time. Chuck attachment is furnished at an addition to the regular price of the machine. Among the advantages claimed are the following: That the machine is simple in construction; that as compared with a power grinding machine it will do equally as good work; that it is portable and requires but little space; that lost motion on the machine can be easily taken up; that it is constructed without belts or chains, and that the operator sits comfortably while grinding. The makers state that with the machine sickles can be ground, saws gummed, skates ground, razors concaved, metal polished, scissors and all kinds of tools sharpened, and that it will be found suitable for general farm purposes.

THE LETTER BOX.

Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.

Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.

WANTS HELP IN BRAZING.

From F. A., Attleboro, Mass.—Belng in need of a little information about brazing, I know of no better way of obtaining it than through the columns of *The Metal Worker*, where, with the kindly help of "Inspector," I have already learned considerable about lead burning, the use of the compound blow pipe, and the hydrogen flame. In fact, I have made all the apparatus described by "Inspector" in his articles in *The Metal Worker* of July 14, August 25 and December 15, 1900.

A short time ago my employer asked me if I could braze a copper tank for him. I told him I was willing to try. The tank was 8 feet long, 15 inches wide and 15 inches deep, and made of copper about 1-16 inch thick. It was made up by the tinsmith and double seamed. The work I had to do was to braze the seams on the inside. You will probably think it was quite a formidable undertaking for an inexperienced hand. That is what I thought when I tackled it. I raised one end of the tank so as to form an angle to work in. I first applied the flame of a compound blow pipe on the top side, but found I could not get heat enough, so I got a plumbers' furnace and put that underneath the seam, and thus, by getting the spelter and flux in the seam between two fires, I was able to make them flow. It was a long, tedious job, because I had to keep moving my furnace along as the work progressed. I got the tank perfectly tight, although if the seam had been smoother I should have liked it better. I used powdered borax for flux. I am now asked to braze another tank, which is larger than the other, and would like a little help in the way of information. What would be the proper way to heat the seams? Should the spelter and flux be mixed together with water, or applied separately? Should the spelter be placed along the seam before or after applying the heat, and should much flux be used or only a little? The borax I used was powdered borax, and the spelter fine. If you can help me out in this matter, or will place it in the way of some one that can, I shall be much obliged to you.

CASE HARDENING METALS.

From C. & L., Eagle, Neb.—Please publish in your next issue a good, simple formula for case hardening metals, iron and gun metals especially.

Answer.—Articles to be case hardened are imbedded in calcined bone and charcoal or burnt leather, or some trade preparations answering the same purpose, the whole being inclosed in a cast iron box provided with a lid which is luted on. The whole is then placed in a furnace and subjected to a heat of from 1000 to 1200 or 1300 degrees for a time sufficient to thoroughly heat the articles. The articles are then dumped into a tank of water. By this means a carbonization takes place in the iron, the carbon being supplied by the imbedding material. The depth of hardening depends almost entirely upon the time the articles are left in the furnace. The mottled effect sometimes called peacock colors seen on some finished steel articles may be produced by the introduction of pieces of leather distributed irregularly about the piece to be hardened.

FASTENING CORRUGATED IRON ROOFING.

From O. C. R., Grand Forks, B. C.—Will *The Metal Worker* kindly inform me what will be the best way to fasten corrugated iron roofing to the steel rafters of iron frame buildings? We are erecting one here for a smelting company and have to fasten corrugated roofing to a 2 x 3 inch angle iron. Is there some clamp used for this purpose? We shall be glad to receive any information that will aid us in doing this work.

PIPE COIL AIR BOUND.

From H. E. F., Heuvelton, N. Y.—I submit herewith a sketch of a hot water system which does not work, and I shall be glad to have the Letter Box or some of its readers help me out. Sometimes the water will circulate, but usually it will back up in the return pipe and rattle. The heating coil in the furnace is 18 inches in diameter and makes three complete circles. It is made of 1½-inch pipe, and connected with the pipe coil 50 feet distant by 1-inch pipe. The radiator is composed of eight runs of 1-inch pipe, 30 feet long, made into a trombone coil with close return bends. This pipe radiator has a pitch of 2 inches in its 30-foot length. The expansion tank is connected with the return pipe as shown, and has a faucet in it so that hot water can be drawn for domestic use.

Note.—We shall be glad if our readers will give their views as to the cause of this trouble. Meantime we think that if our correspondent will examine the different runs

Pipe Coil Air Bound.

of the pipe coil, he will find that air has accumulated in some of them to such an extent as to interfere with the circulation. Better satisfaction would probably have been derived from the use of a miter coil made with manifolds instead of the coil used. Then the 1-inch pipes would have more readily freed themselves from air. Owing to the long run from the furnace to the coil a 1½-inch supply and return pipe should have been used, which would have aided in the heating.

PATTERN FOR A ROUND CRUTCH.

From Tinsmith, New York.—I want to make a crutch that is round, and wish that some reader of *The Metal Worker* would be kind enough to explain the laying out of the pattern. I have learned to lay out the pattern for a crutch of the shape described in *The Metal Worker* of October 5, but I cannot construct one that is round.

Note.—Problem 207 in "The New Metal Worker Pattern Book" covers the case in question. This is a pattern for a Y consisting of two tapering pipes joining a larger pipe at an angle, all these pipes being round.

NAME AND ADDRESS WANTED.

Will the correspondent who sends us an interesting communication under the pseudonym of "Kicker" furnish us, for our own information and not for publication, with his name and address, as required by the conditions printed at the head of this department?

The Mineral Production of the United States.

According to a report issued recently by the United States Geological Survey, the total value of minerals of all kinds produced in the United States in 1900 was \$1,070,108,899. The total production for 1899 was \$1,211,361,861, and for 1898 \$861,751,017. The total value of the metallic products was \$552,418,627, the nonmetallic \$516,690,262, and estimated value of mineral products, unspecified, \$1,000,000.

Among the more important minerals there were 13,789,242 long tons of pig iron produced in 1900, with a value of \$259,944,000, as against 13,400,735 long tons in 1899 and a value of \$234,725,754. There was a total of

363,735,265 tons of coal, anthracite and bituminous, with a value of \$306,890,364, as against 252,115,387 tons, valued at \$276,147,056, in 1899.

Other figures of some of the leading metals and minerals, as officially announced, are as follows:

Copper, 606,117,166 pounds; value at New York City, \$98,494,039.

Lead, 270,824 short tons; value at New York City, \$23,561,688.

Zinc, 123,886 short tons; value at New York City, \$10,654,196.

Quicksilver, 28,317 flasks; value at San Francisco, \$1,302,586.

Aluminum, 5,200,000 pounds; value at Pittsburgh, \$1,716,000.

Antimony, 1750 short tons; value at San Francisco, \$346,980.

Nickel, 9715 pounds; value at Philadelphia, \$3886.

Platinum, 400 troy ounces; value (crude) at San Francisco, \$2500.

Bituminous coal, 212,513,912 short tons; value, \$221,133,513.

Pennsylvania anthracite, 51,221,353 long tons; value, \$85,757,851.

Natural gas, value, \$23,606,463.

Petroleum, 63,362,704 barrels; value, \$75,752,691.

Corundum and emery, 4305 short tons; value, \$102,715.

Grindstones, value, \$701,121.

Mineral paints, 72,222 short tons; value, \$881,363.

Zinc white, 48,840 short tons; value, \$3,667,210.

Asbestos, 1054 short tons; value, \$16,310.

Asphaltum, 68,429 short tons; value, \$491,598.

Bauxite, 23,184 long tons; value, \$89,676.

Graphite, crystalline, 5,507,855 pounds, and amorphous, 611 tons; total graphite value, \$197,579.

Mica, 456,393 pounds of sheet; value, \$92,758, and scrap, 5453 tons; value, \$54,302.

Delicate Measurements.

It requires but a glance at the catalogue of a manufacturer of measuring instruments to show that in order to be abreast of the times it is necessary to measure iron and steel used in the construction of delicate machinery to the 1-1000 inch, and in exceptional cases to 1-10,000. This is not difficult to talk about, says the *Tradesman*, but when a mechanic begins to put the theory of such fine measurements into practice great care is necessary in order to secure satisfactory results.

Everybody knows that heat expands and cold contracts metals, but for ordinary purposes nobody thinks of taking this into account. If an iron rod is to be made 3 feet long, to be used for some parts of an engine valve gear, it is not customary to state the temperature at which it must measure 3 feet. If it is 36 inches long at 32 degrees F. it certainly will be longer than 36 inches at 74.

Where very great accuracy is imperative and two rods must be the same length, they must be brought to the same temperature and kept there. If the thumb of a person in good health is laid upon the bulb of a thermometer, the mercury will begin to rise at once, and if a brass rod 2 feet long at a temperature of, say, 40 or 50 is grasped firmly in both hands, and held for a few minutes, the heat so imparted to it will change its length enough to be objectionable for very fine work.

Removing Rust and Grease from Marble.

As most of our readers are doubtless aware, says the *Decorators' Gazette* of London, rust spots on marble are caused, as a rule, when articles made of iron are laid on the marble when it is wet, or allowed to remain there when the atmosphere is in a humid condition. These spots penetrate somewhat deeply, as marble is very porous, and can be effaced only by rubbing the marble sufficiently deep to remove the spots, and then repolishing the surface. As even the weakest acids will destroy marble such radical treatment cannot be entertained, or oxalic acid would immediately suggest itself as the correct remedy.

Grease spots from whatever cause, or the marks made by touching with soiled hands, can be removed by applying to the surface a stout paste made of equal parts of slacked lime and white pipe clay mixed with water, or calcined magnesia and white pipe clay will do equally as well. The paste must be applied in a thick layer all over the affected surface, and there permitted to remain for a couple of days, during which time it must be frequently moistened with water, and only allowed to dry after the full two days are passed, when it can be easily removed by rubbing with a soft cloth. Then the surface should be polished with the finest bolted whiting, and a piece of soft leather. This treatment cannot be applied to imitation marbles.

TRADE REPORT.

MARKET SUMMARY.

Pig Tin is dull and weak.
Copper prices are well maintained, spot Lake is scarce.
Pig Lead is quiet and unchanged.
Spelter is very firm, with a good demand.
Antimony is unchanged.
Nickel continues firm with good demand.
Aluminum is active at former prices.
Tin Plates are in moderate demand for early delivery; Cokes are slightly lower, also Terne Plates.
Sheets are still scarce and strong with heavy demand.
Old Metals are quiet and unchanged.
Sheet Copper is moving well, with prices firm.
Sheet Zinc is in moderate demand and unchanged in price.
Foundry Iron is in active demand, with prices quite firm.
Hardware continues to move in good volume, with prices generally firm.
Plumbers' Supplies are active, and prices rule steady and strong.
Cast Iron Sinks are likely to advance in price on probable formation of a pool in these goods.
Wrought Iron Pipe prices are unchanged, with some scarcity still prevailing.
Sanitary Earthenware is in heavy demand and prices firm.
Solder has been reduced 1c. a lb.
Registers are stiffer in price.
Shot is firm.
Wire Nails are in good demand at unchanged prices.
Cut Nails are rather scarce; prices show no change.
Wire continues firm and in heavy demand.
Window Glass is in moderate demand at unchanged prices.
White Lead is firm and demand is active.
Linseed Oil is scarce and steady in price.
Spirits Turpentine has advanced $\frac{1}{2}$ c. a gallon.

METAL MARKET.

NEW YORK, October 18, 1901.

Pig Tin.—As far as the actual consuming business was concerned, the market during the past week was very quiet. During the period of the recent declining market most of the large consumers covered their requirements for the balance of this year, and the smaller consumers are, as usual, buying only what they actually require for the filling of business in hand. The market itself was a little firmer early in the week, owing to an advance in prices in London, but settled down again into a weak and unsettled condition on Thursday, in consequence of depressing advices from the other side and the absence of any active buying. Straits Pig in small lots is quoted at 25 $\frac{3}{4}$ c. to 26c. per lb.

Copper.—Lake Copper for spot delivery is now scarce, and consumers find themselves forced to pay the full price demanded by the principal producers. Only small lots, however, are changing hands at the high figures. The large consumers are of the opinion that the market will certainly not advance, and are getting along with just as small a stock of Copper as possible. While it is authoritatively announced by those in touch with the great producing interests that there will be no decline in the price of Copper before January 1, an impression still prevails in the trade that prices may recede before a great while, and this serves to keep the market somewhat unsettled. Lake Ingot in small lots is still quoted

at 17 $\frac{1}{4}$ c. to 17 $\frac{1}{2}$ c. per lb., and Casting Copper at 16 $\frac{3}{4}$ c. to 17c. While the production of Copper in the United States during September is about the same as for the corresponding period of last year, that of the reporting mines of Europe has increased from 7839 tons for September, 1900, to 9479 tons for this year, an increase of 20 per cent., which is regarded by the trade as of considerable significance.

Sheet Copper.—The demand for Sheet Copper keeps up in satisfactory volume. Prices continue firm on the basis of 21c. per lb. for moderate sized lots from store.

Pig Lead.—No change has taken place in this market, which is decidedly quiet. Prices remain unchanged from those ruling for some time past. American Pig in small lots is quoted at 4.62 $\frac{1}{2}$ c. to 4 $\frac{3}{4}$ c. per lb. St. Louis advices report the Pig Lead condition in that market as unchanged, with a good demand and no variation in prices.

Spelter.—This metal continues to grow firmer. The consumption throughout the country is reported to be good, and while there may be some manipulating influence behind the present upward movement, no disposition is shown in any quarter to retard its progress. Producers consider that the price of Spelter has been so low for the last two or three years that any advance would be welcome, no matter how it comes. Good Western brands in small lots are quoted at 4.55c. to 4.60c. per lb. A report which is creating interest in the trade is to the effect that the Lanyon Zinc Company of Iola, Kan., are building a large Sheet mill, and will enter the market with Sheet Zinc. It is expected to have the mill turning out its product by the end of this year. St. Louis advices report a steady and large demand for Spelter and prices advancing, with apparently no diminishing of the buying power.

Sheet Zinc.—No change has taken place in the market for this material. Jobbers are quoting 600-lb. cask lots at 6 $\frac{3}{4}$ c. per lb., and smaller quantities at 7c.

Antimony.—Is unchanged, Hallett's being quoted in small lots at 8 $\frac{1}{2}$ c. to 9 $\frac{1}{4}$ c. per lb., and Cookson's at 10 $\frac{1}{2}$ c. to 11c.

Nickel.—No change is reported in connection with this metal. Prices are firm, small lots being quoted at 60c. to 65c. per lb.

Aluminum.—An active demand continues, and prices remain at 37c. per lb. for small lots of No. 1 Ingot, guaranteed 99 per cent. pure, and 35c. for 100-lb. lots.

Tin Plates.—A moderate demand for spot and early deliveries is noted, but there is no particular snap to the market. A few shipments have come into the Eastern market from the American Tin Plate Company's mills since they started up. The mills appear to be working almost exclusively upon Coke Plate for canners' use. No Charcoal or Terne Plates have made their appearance so far. Meanwhile the scarcity of stocks in jobbers' hands continues as pronounced as ever. The American Tin Plate Company announced this week that they will take orders for the first quarter of next year at unchanged prices. While retail quotations are still merely nominal, a fair average quotation for American Bessemer Coke Plates, I C, 14 x 20, delivered in moderate sized lots in New York or corresponding points, would be \$6.50 to \$6.75 per box. The market for Welsh Plates scored another decline during the week.

Sheets.—The demand for Sheets continues. The bulk of the mills are out of the market as sellers for delivery during the rest of the year. A good deal of tonnage in Sheets has been booked for next year, and the outlook promises that the Sheet mills, as a whole, will have plenty of work to keep them busy throughout the winter months. Jobbers in this section are complaining of the difficulty of securing enough supplies to meet the de-

mands of their customers. Deliveries from the mills are coming in very slowly, and as a rule are sold out before they are received. Jobbers' prices on Black Sheets in moderate sized lots are unchanged at 4.15c. to 4.20c. for No. 27, One Pass, Colled Rolled Soft Steel Sheets. Galvanized Sheets are quoted at 65 per cent. off the list.

Chicago advices are as follows: Although the mills appear to be making better deliveries, the supply of Black Sheets is not yet adequate to the necessities of consumers in this territory. Scarcity is also felt elsewhere, as indicated by orders received here for shipment from Chicago stocks, such shipments being made to Pittsburgh among other Eastern points. Prices of Black Sheets are still arbitrary, depending to a great extent on the condition of stocks, but may be quoted on a basis of 4c. to 4.10c. for No. 27. A stronger demand is experienced for Galvanized Sheets, and assortments are again badly broken, some of the leading jobbers finding Standard sizes running very short. Small lots are quoted at 65 off.

Old Metals.—The market for Old Metals of other descriptions is quiet, but prices are well maintained. Dealers are paying about the following prices for moderate sized lots, delivered at New York or corresponding points.

Heavy Copper.....	per lb. 14¾c.
Light and Tinned Copper.....	per lb. 12¾c.
Heavy Brass.....	per lb. 9¾c.
Light Brass.....	per lb. 7½c.
Lead.....	per lb. 4 c.
Tea Lead.....	per lb. 3½c.
Zinc.....	per lb. 2¾c.
No. 1 Pewter.....	per lb. 17½c.
No. 2 Pewter.....	per lb. 8½c.
Tin Plate Scrap, per gross ton.....	\$6.50 to \$7.00
Wrought Iron Scrap, per gross ton.....	10.50 to 11.00
Heavy Cast Scrap, per gross ton.....	10.25 to 10.50
Stove Plate Scrap, per gross ton.....	7.25 to 7.50
Burnt Iron, per gross ton.....	5.00 to 5.50

THE PIG IRON MARKET.

NEW YORK.—With the exception of one transaction, involving about 6000 tons of Iron, no sales of any magnitude are reported in this market. Consumers are testing the market for the first and second quarters of next year, but are apparently unwilling to pay current prices. We quote: Lehigh, Schuylkill and Virginia Irons, No. 1, \$16 to \$17.50; No. 2 X, \$14.75 to \$15.75; No. 2 Plain, \$14 to \$14.50; Tennessee and Alabama brands, No. 1 Foundry, 15 to \$15.50; No. 2 Foundry, \$14.75 to \$15; No. 1 Soft, \$14.75 to \$15; No. 2 Soft, \$14.50 to \$14.75; No. 3 Foundry, \$13.75 to \$14; No. 4 Foundry, \$13.50 to \$13.75.

CHICAGO.—A good, healthy trade is in progress, which keeps sales agents quite busy, although the demand is not so brisk as during the preceding three or four weeks. Numerous buyers are coming into the market, and placing orders for moderate quantities for delivery during the opening months of the coming year. Quite a sharp demand is noted for Iron for immediate shipment. Spot Iron is very scarce, and it is particularly difficult to secure Foundry grades. No complaint is heard with regard to prices. The Southern furnace companies are apparently maintaining the advance recently made, while sellers of local brands have marked up their prices slightly. We quote as follows:

Lake Superior Charcoal.....	\$17.00 to \$18.00
Local Coke Foundry, No. 1.....	15.25 to 16.00
Local Coke Foundry, No. 2.....	14.75 to 15.25
Local Coke Foundry, No. 3.....	14.25 to 14.75
Local Scotch, No. 1.....	15.25 to 16.00
Ohio Strong Softeners, No. 1.....	16.00 to 16.50
Southern Silvery, according to Silicon.....	15.40 to 15.65
Southern Coke, No. 1.....	15.15 to 15.40
Southern Coke, No. 2.....	14.40 to 14.65
Southern Coke, No. 3.....	13.90 to 14.15
Southern Coke, No. 1 Soft.....	15.15 to 15.40
Southern Coke, No. 2 Soft.....	14.40 to 14.65

PHILADELPHIA.—The market holds its own very satisfactorily. Sales have been at a fair average of prices compared with those of the past two or three weeks, but it cannot be said that the upward tendency has made much headway. Makers, however, are so well sold up that there is no need of shading prices at present, although it is a seriously considered question whether or not it should be done on next year's shipments. Sales are being made for this year's shipment at about \$14.50 for No. 2 Plain, and \$15 for No. 2 X, with occasional sales at 50c. more. The general range for the entire market is about as follows for city and nearby deliveries,

and from 25c. to 50c. less at points within a radius of 100 miles South or West: No. 1 X Foundry, \$15.50 to \$16; No. 2 X Foundry, \$15 to \$15.50; No. 2 Plain, \$14.50 to \$14.75.

PITTSBURGH.—The heavy purchases of Iron by the United States Steel Corporation and other Steel interests have cleaned up the surplus material for October and November, and the market is very strong. There have been heavy purchases of Foundry Iron for the last quarter of this year, also for next year, when prices were lower and the market has advanced materially. We quote No. 1 Foundry at \$15 to \$15.25; No. 2, \$14.50 to \$14.75, and No. 3 at \$14 to \$14.25, all f.o.b. Pittsburgh.

CINCINNATI.—The situation in the Pig Iron market is practically unchanged from what it was a week ago. The main body of business has been in Foundry Iron, for which a large number of orders, ranging from 700 to 800 tons down, have been placed. There is practically but one price for Southern Iron, and that is on the basis of \$11, Birmingham, for No. 2. Almost all the business transacted represents contracts covering the first half of next year. There is a good strong demand, and in some cases an urgent demand, for immediate delivery of Iron, but it is very scarce, and, in fact, almost impossible to secure any of the popular grades for delivery within the next three months. The outlook for the coming week is for a continuation of the present good business, and the whole situation may be classed as excellent. We quote, f.o.b. Cincinnati:

Southern Coke, No. 1.....	to \$14.25
Southern Coke, No. 2.....	to 13.75
Southern Coke, No. 3.....	to 13.25
Southern Coke, No. 4.....	to 12.75
Southern Coke, No. 1 Soft.....	to 14.25
Southern Coke, No. 2 Soft.....	to 13.75
Southern Coke, Gray Forge.....	to 12.75
Southern Coke, Mottled.....	to 12.75
Ohio Silvery, No. 1.....	\$14.60 to 15.00
Ohio Silvery, No. 2.....	14.10 to 14.60
Lake Superior Coke, No. 1.....	15.10 to 15.60
Lake Superior Coke, No. 2.....	14.60 to 15.35
Lake Superior Coke, No. 3.....	14.10 to 14.85

ST. LOUIS.—The Pig Iron market is now in a state of great activity. While the tonnage of individual orders is not generally on an unusual scale, there has been a marked increase in this direction since our last report. It is said that the bulk of the business now being placed is for delivery by the end of the year, and some difficulty is experienced by the furnaces to promptly fill this demand. We quote as follows for cash, f.o.b. St. Louis:

Southern, No. 1 Foundry.....	\$14.75 to \$15.00
Southern, No. 2 Foundry.....	14.00 to 14.25
Southern, No. 3 Foundry.....	13.50 to 13.75
Southern, No. 4 Foundry.....	13.00 to 13.25
No. 1 Soft.....	14.50 to 14.75
No. 2 Soft.....	14.00 to 14.50

CHICAGO REPORT.

Scrap Iron and Steel.—The supply is increasing, and prices are expected to decline, although a fair demand prevails. Dealers quote the following buying prices, in carload lots, Chicago delivery:

	Per net ton.
Country Wrought Scrap.....	\$11.00 to \$12.00
Machinery Cast.....	10.50 to 11.00
Malleable Cast.....	10.00 to 11.00
Stove Plate (free from burnt).....	to 8.00
Burnt Iron and Grate Bars.....	5.50 to 6.00
Sheet Iron and Hoops.....	6.00 to 7.00
Plow Steel.....	to 10.00
Breaking Stock.....	9.00 to 10.00
No. 2, such as Shovels, Hoes, &c.....	to 7.00
Old Boilers—whole (Iron).....	6.00 to 7.00
Old Boilers (Iron) cut in single Sheets and Rings.....	9.50 to 10.00
Old Gas Pipe and Boiler Tubes.....	11.00 to 11.50
Cast Borings.....	4.50 to 5.00
Turulings.....	9.50 to 10.00
Horseshoes.....	to 13.00

Old Metals.—Trade is quiet. Dealers quote buying prices on small lots as follows:

	Per lb.
Copper Wire and Heavy.....	14½c.
Copper Bottoms.....	13 c.
Copper Clips.....	14 c.
Red Brass.....	13¼c.
Yellow Brass.....	9¼c.
Red Brass Borings.....	11¼c.
Yellow Brass Borings.....	8½c.
Light Brass.....	7½c.
Pipe Lead.....	4 c.
Tea Lead.....	3½c.
Zinc.....	2 80c.
Tin Foil.....	22 c.
Pewter, No. 1.....	17½c.
Pewter, No. 2.....	14 c.

Old Rubber.—The movement is fair, with some change in values. Dealers' buying prices are as follows:

	Per net ton.	Per lb.
Garden Hose.....	\$25.00
Alr Brake Hose.....	42.50
Rubber Shoes.....	5½c.
Rubber Car Springs.....	5½c.
Inside Bicycle Tubing.....	22 c.
Outside Tubing.....	7¼c.
Black Rubber.....	4¼c.
White Rubber.....	8¼c.

Rags.—Buying price of good country Mixed Rags, Chicago delivery, is 70c. to 80c. per 100 lbs., in any quantities.

Anthracite Coal.—The demand is very good, but the supply is running short, owing to the decided scarcity of cars for shipping from the mines. The schedule for carload lots is as follows:

	Grate.	Egg and Stove.
Chicago	\$5.75	\$6.00
Milwaukee, Wis.....	5.75	6.00
St. Louis.....	6.20	6.45
Kansas City, Mo.....	8.25	8.50

THE HARDWARE TRADE.

The business situation shows but little change from week to week. There is a steady business being done by the retail trade, and this is a good indication of the general condition, for when trade is satisfactory with this class of merchants it indicates a healthful state in general. With the coming of fall weather there is throughout the country a quickening in the demand for fall and winter goods, and jobbers report a very satisfactory activity in these lines, but with difficulty in having their wants adequately supplied, as there is more or less scarcity in many directions. The pressure, however, is relaxing on many kinds of heavy goods, especially those the production of which was interfered with by the strike. The market has witnessed but little change in prices within a few weeks, except in special instances where combinations for one reason or another have come to grief. While values, as a rule, are steady, and merchants are buying in such quantities as their trade requires, they are not disposed to speculate, anticipating that goods are not likely to be materially higher. Most merchants are conducting their business with enterprise, but still conservatism, on the theory that present conditions, without important change, are likely to continue into the new year. They do not find justification for buying in excess of their wants for the near future, but place orders to this extent with confidence. The jobbers being, as a rule, pretty well supplied with goods, the demands which are being made by them upon the manufacturers are not especially heavy, but stocks in manufacturers' hands also are light and broken, and in many kinds of goods the makers are still behind their orders.

NOTES ON PRICES.

Cast Iron Sinks.—It was learned this week that an effort is being made to place the Cast Iron Sink business in a more profitable position than that existing recently. The scheme is said to be to get all of the manufacturers of Cast Iron Sinks and goods of a kindred nature into a "pool," which will regulate prices and production in a manner similar to that by which the Cast Iron Soil Pipe business is controlled. Considerable progress, it is said, has been made in this direction, and if the efforts of the promoters of the deal are successful the price of Cast Iron Sinks of all kinds and sizes, Sink Backs and Legs, Slop Hoppers and Stands, Brackets, Wash Tray Legs, Traps, Cesspool Grates, Stench Traps, Cesspool Plates and Strainers, and, in fact, all goods of this nature will be likely to undergo a material advance before the first of the new year. We understand that the manufacturers have come to an agreement with the promoters to make no new contracts for Sinks to be delivered after January 1, 1901. It is also understood that no large orders are to be taken prior to that time. The manufacturers have made returns of their production and allotments of new business will be made to the members of the pool according to the size of their past business in this line.

Wrought Iron Pipe.—The condition of the Wrought Iron Pipe market is very similar to that of last week. Prices at the mills and with the jobbers remain unchanged. There is more Pipe in the market this week, but this is offset to a great extent by a larger demand than then prevailed. The bottom seems to have been reached by the jobbers, and the mills being well sold out will wait for some time before making any change either way.

Sanitary Earthen Ware.—Judging from reports of the Trenton, N. J., potters, the Plumbers' Earthen Ware business is in a flourishing condition. The kilns are being kept in continual use and the manufacturers, as a rule, are behind with their orders. The association formed two years ago is still in existence, and it is understood that there is not a single pottery outside of it. This condition of affairs applies, too, to the Western potteries, who are also affiliated with the Trenton Association. Prior to the organization of the Potters' Association the business was in a very unsatisfactory condition. Prices were ruinously low, claims and allowances were the order of the day, and the demand was not nearly in as good volume as it is at the present time. The kiln capacity of the Trenton potteries has been nearly doubled in the past two years and more kilns are being erected in anticipation of an increased demand for newer and more modern sanitary appliances. The pottery business has been so successful since the formation of the association that it is believed to be certain that a renewal of the present agreement will be made to maintain the current prices for another year.

Solder.—A further reduction has been made by the manufacturers of Solder, in sympathy with the decline in Pig Tin. Half and Half Solder, guaranteed, in small lots, is now quoted at 17 to 17½ cents, and No. 1, 14 to 15½ cents per pound.

Registers.—The market for Registers and Ventilators is in an improved condition, and most of the manufacturers are announcing higher base discounts, 60 and 10 per cent. being the figure named by leading makers. Some others, however, are naming lower discounts, and the market is thus not entirely even. The prices which have ruled on this line for some time are referred to by the manufacturers as unprofitably low, and with the good demand which prevails, they are endeavoring to realize more substantial returns.

Shot.—The market for Shot is in better condition than for some time, and prices are being quite firmly maintained. The disturbance from the lower quotations made by jobbers has, to a good extent, ceased, as their stocks purchased at low prices are becoming exhausted.

Wire Chain.—The Bridgeport Chain Company, Bridgeport, Conn., manufacturers of Triumph and Brown Chains, and the Oneida Community, Kenwood, N. Y., makers of Niagara and Eureka Chains, have adopted a uniform price-list for the above brands of Chains, under date of September 16.

Nuts.—A meeting of the manufacturers of both Hot Pressed and Cold Punched Nuts was held October 15, and the following revised quotations adopted, which are subject to the usual abatement on large lots:

	Off List.
Hot Punched Square Blank Nuts.....	5.20
Hot Punched Hexagon Blank Nuts.....	5.80
Hot Pressed Square Tapped Nuts.....	5.00
Hot Pressed Hexagon Tapped Nuts.....	5.60
Cold Punched Plain Blank Square Nuts.....	5.00
Cold Punched Plain Blank Hexagon Nuts.....	5.30
C. T. & R. Blank Square Nuts.....	5.20
C. T. & R. Blank Hexagon Nuts.....	5.80
Cold Punched Plain Tapped Square Nuts.....	4.80
Cold Punched Plain Tapped Hexagon Nuts.....	5.10
C. T. & R. Tapped Square Nuts.....	5.00
C. T. & R. Tapped Hexagon Nuts.....	5.60

Wire Nails.—Wire Nails are meeting with an excellent demand at unchanged prices. Small lots at store are quoted in New York at \$2.60 per keg.

Cut Nails.—There is a general complaint among the Cut Nail mills of their inability to obtain Steel. This has resulted in delaying the shipments of Steel Nails,

with accompanying annoyance to the trade. The scarcity of Steel Nails has been so pronounced that in some instances buyers have been obliged to accept Cut Iron Nails as a substitute. Trouble in this direction has not been experienced in connection with Wire Nails, as most of the mills make their own Steel. The New York demand is referred to as fair, but jobbers complain of delayed shipments from mills. Small lots of Cut Nails from store are quoted at \$2.18 to \$2.30 per keg.

Wire.—The heavy demand for Plain Wire continues unchanged, the output of the mills being taken as fast as made. Prices are firm and only for very desirable orders at competitive points are any concessions in prices being made. Plain Wire in small lots is quoted at 2.60 cents, and Galvanized at 3 cents.

Window Glass.—The demand for Window Glass for the past few weeks has not been up to expectations. One explanation is that the weather has continued mild, so that dealers have not been called upon to supply the requirements that accompany the first decidedly cold weather. There was a general start of the co-operative Glass factories on October 15. The plants of the combine are expected to go into operation on November 1. Jobbers' quotations are unchanged at the discount of 80 and 20 per cent. for less than car lots from store.

White Lead.—The demand for White Lead in Oil continues in good volume. The scarcity of Oil has caused some inconvenience, although it has not reached any serious extent. In other than the local market irregularities in prices are reported. White Lead in Oil is quoted in a retail way at 7 to 7¼ cents per pound.

Linseed Oil.—The scarcity of spot Oil is still the prominent feature of the market. The crop of Flaxseed from the Northwest is from two to four weeks late in getting into the hands of crushers, who, in consequence, have been able to make only partial shipments of Oil contracted for early October delivery. The demand is active for small lots only, as buyers expect prices to be lower when present conditions change and the market settles. City Raw Oil is quoted in moderate sized lots at 66 to 67 cents per gallon. Boiled Oil is 2 cents per gallon advance on Raw.

Spirits Turpentine.—While the local Turpentine market has been quiet owing to the absence of large buyers, a firmer tone in the South has caused prices to advance ½ cent per gallon. Business at this point is confined to jobbing lots. Retail quotations are 38½ to 39 cents per gallon.

Scrap Aluminum.

There seems to be considerable misunderstanding among metal dealers and others less directly connected with the aluminum trade as regards the matter of the value of aluminum scrap, says the *Aluminum World*. The price for aluminum scrap is, of course, set by the best informed buyers, and is always just sufficiently below the price of new metal to leave margin for remelting, cost of selling, and profit. The recent average market price paid for aluminum scrap by those dealers who are doing a considerable business in the light metal has been from 24 cents to 25 cents per pound, and as high as 26 cents. While this price has eased a trifle lately, scrap dealers who do not handle aluminum regularly, but who merely pick up a stray lot now and then, can hardly be considered an authority on the market quotation for aluminum scrap. The above quotations apply to pure aluminum scrap only, and not to alloyed or otherwise second-grade metal.

THE NEW JERSEY ZINC COMPANY have filed at Trenton, N. J., a mortgage for \$10,000,000, part of which is to secure the payment of an issue of 4 per cent. 25-year bonds. Four millions of dollars of this money is to be devoted to the development of property now owned by the company, while the remainder is to be used to secure new plants in the Western States. One of the schemes contemplated by the company is the completion of the town of Palmerstown, near Bethlehem, Pa., which

is being built around the site of a newly acquired Zinc mine. Palmerstown is named for the company's president, S. S. Palmer. A large plant is to be situated there, and many buildings are now in course of erection. The New Jersey Zinc Company control all the Zinc produced in the East, and are now reaching out to secure several Western mines.

Sheet Metal Pattern Drafting

A course of instruction by mail for tinsmiths, coppermiths, plumbers, sheet-iron workers, furnace workers, skylight makers and others that will enable a student to "strike out" working patterns for all kinds of sheet metal work. This is what a student says:

His Course More Than Paid for Itself

I am a tinsmith, and consider your course in Sheet Metal Pattern Drafting one of the best investments I ever made. Before I was half through I had realized from it more than the money paid for the whole course.

M. E. TOBIAS, 1st
63 Fifteenth St.,
Wheeling, W. Va.

We teach by mail Mechanical, Steam, Electrical, Civil and Mining Engineering; Shop and Foundry Practice; Mechanical Drawing; Architecture; Plumbing; Sheet Metal Work; Telephony; Telegraphy; Chemistry; Ornamental Design; Lettering; Book-keeping; Stenography; Teaching; English Branches; Locomotive Running; Electrotherapeutics. When writing state subject in which interested.

taught by mail.

TINSMITHS HELPER *and* PATTERN BOOK

WITH USEFUL RULES,
DIAGRAMS and TABLES
= By H. K. VosBurgh =
NEW AND IMPROVED EDITION

A USEFUL hand-
book for tin-
ners and other
mechanics, treat-
ing simple prob-
lems in pattern
cutting, such as
are of daily occur-
rence in the shop.
An elementary
manual for the
young tinsmiths;
A handy reference
for all sheet metal
workers.

120 Pages
53 Figures

An Invaluable \$1.00
Pocket Companion . .

Section 1 ~ Pages 1-66 Diagrams and Patterns

Demonstrates in a simple way, and by means of illustrations and descriptive text, about 50 examples of sheet metal pattern work, such as the method of cutting can breasts, flared tinware, scale scoops, oval boiler covers, lips for measures, elbow patterns, &c.

Section 2 ~ Pages 69-88 Epitome of Mensuration

Compiled with regard to the requirements of the tinner, describing how to find the area of a circle, the circumference of a circle, the contents of a sphere, a cylinder, a cone, and other information relating to the work of a tinsmith.

Section 3 ~ Pages 89-120 Tables, Rules, Recipes

Gives tables of the weights of sheet metals, including the weight of black sheet iron, sheet lead, and galvanized iron sheets with their dimensions; the weight of lead pipe per foot; the weights of tin plates, sheet copper and sheet zinc. Several pages are devoted to tables giving the areas and circumferences of circles, the capacity of cans, the number of barrels in cisterns and tanks, sizes of tinware in form of frustum of a cone, &c., and practical receipts, including mixtures for solders of different kinds, soldering fluxes, and various cements.

Cloth Bound, \$1.00 Postpaid

THE "RUSSO" SIDE DRAFT VENTILATOR

Differs from all others, not only in form but in its scientific features. The side door system insures a true, perfect draft and the openings prevent back draft and make sweating impossible. Ornamental, storm, dust and cinder proof. The automatic damper in connection with this device is a new idea. Opens automatically and closes by means of a single cord in its center and renders a perfect air-tight damper. Satisfaction guaranteed. Send for circulars and prices.

Architectural Metal Works.
PROVIDENCE, R. I.

A UNIVERSAL REMEDY FOR LEAKY ROOFS.

The valuable qualities of a good roofing cement are firm adhesiveness and elasticity. These qualities the American Seal Builders' and Roofers' Elastic Oil Cement possesses. It will adhere firmly to Slate or Metal and will not crack or crumble. It is especially recommended for repairing leaks around chimneys, dormer windows, skylights, scuttles, firewalls and any place that requires fixing on a roof, either Slate, Tin or Shingle.

This Cement will answer to repair a roof when Solder cannot be used.

PUT UP In Barrels, about 800 lbs. In Tubs, about 112 lbs. In 25 and 50 lb. Pails. In 5, 10 and 15 lb. Pails.

TO HAVE AND TO HOLD!

To have and to hold the best class of metal ceiling trade, you should handle

Berger's Classic has greater variety of patterns to choose from than any other makes of metal ceilings.

Berger's Classic is made in complete and harmonious Classified Designs.

Berger's Classic is distinctively artistic.

Berger's Classic is distinctively deep stamped.

Berger's Classic appeals to discriminating buyers, the class the back number, conglomerated ceilings utterly fail to interest.

Berger's Classic has valuable constructional features, reducing number of joints and making it easier to handle and erect.

Write to-day for catalogue and full particulars.

Berger's Classic is the line it will pay you to push.

NEW YORK BRANCH 157 WEST 23 RD. ST.

The New Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting
as applied to all branches
of sheet metal work.

Cloth Bound, Price \$5.

This work contains a collection
of 218 problems and an elaborate
explanation of the principles of
pattern cutting, including Triangu-
lation.

It embodies the problems of the
former Metal Worker Pattern Book,
all of which have been revised, and
many of which have been entirely
rewritten and solved by more ap-
proved methods. To these have
been added 75 new problems and
much other new material and ex-
planatory matter, making this work
a model of completeness in every
respect.

ARRANGEMENT.

In point of arrangement the new
work far surpasses the former one
in that the problems are classified
under three different heads, and
simply indexed, and also that by
means of a table of contents any
required department of the work
can be easily found.

CONTENTS.

While Chapter VI, comprising the
greater part of the work, is devoted
to the solution of problems, the
five preceding chapters thoroughly
explain the principles of pattern
cutting, and place the student in
possession of the preliminary infor-
mation necessary to a thorough
understanding of the subject.

SUMMARY OF CONTENTS.

- I. Terms and Definitions—15 pages.
- II. Drawing Instruments and Materials—13 pages.
- III. Linear Drawing—6 pages.
- IV. Geometrical Problems—35 pages.
- V. PRINCIPLES OF PATTERN CUTTING—25 pages.
- VI. PATTERN PROBLEMS (3 Sections)—325 pages.
 1. MITER CUTTING.
 2. FLARING WORK.
 3. TRIANGULATION.

All Tanners, Cornice Makers and
Sheet Metal Workers should be
provided with a copy of

The New Metal Worker Pattern Book.

Price \$5, post or expressage paid.

453-55-57 Pearl Street,

CINCINNATI, O.

Actual size of
Washer and Nail.

The Double Truss Cornice Brake.

All the different sizes in which we make this practical machine are herewith illustrated.

This brake costs only half as much as an all-metal brake.

It is made mostly of hard maple.

It is just as good as an iron brake in every respect—much better in some ways. Beside the 50% saved in the first cost our brake will save money in its use.

It is light and can easily be carried from place to place.

By shaping or bending work in the building where it is to be used all the trouble and expense of handling formed-up work is saved.

Write for prices.

SHOWING
DOVETAIL
KEYS.

HERCULES SHEARS

make the cutting of sheet metal of heavy gauges an easy task for the mechanic and a profitable operation for the employer. With them a man can cut No. 12 steel with one hand on the lever, leaving the other hand free to guide the stock while cutting elbows, ties and circles, as small as 8 inch radius; this is done without burring or buckling either piece, thus avoiding hammering and straightening, which add to the cost of the product. They split sheets of any width or length up to No 12 gauge, cut wire or bar-steel $\frac{1}{8}$ inch thick, cut off and mitre angle iron $\frac{1}{8}$ inch thick, and do it perfectly.

PRICE, - - \$35.00.

Write for Discount.

THE OVEN RACK

IN THE

New Model Grand

is one of the bright thoughts of the New Century. But little attention has heretofore been paid to this attachment in modern Range Construction. By a simple locking device the Model Grand Oven Rack, when pulled out to its full width, remains rigidly in position, affording opportunity for turning around the roast or the loaf without reaching into the hot oven. Then it can be pushed back into position. It is removable as readily as the ordinary rack. It is aluminum plated, so that it can be easily cleaned.

Paragon Point No. 6.—PERFECT ADAPTABILITY.

While hard coal is mostly used in the Paragon Furnace, we make it to burn soft coal as well, and pea coal or coke can be burned in any size and any style. The Paragon line is also adapted to low cellars, and we have a form of it for bricksetting. We also make a combination Paragon with either steel or cast iron radiators.

This point means that whatever your requirements may be in the furnace line, you need not go outside of the Paragon Furnace catalog to meet them.

MAKERS OF GOOD GOODS ONLY

If you are going out of business next year and value not the good will of your neighbors, sell "paste board" heaters, otherwise handle good goods.

NEW PALACE KING Hot Blast

Smoke Consumer
WARM AIR FURNACE.

FOR SOFT COAL.

All Cast Iron. Strictly High Grade.
Very Durable.

The Hot Air Blast Appliance

Is so formed that the distribution of the hot air to the combustion chamber is equally divided at three points:—at the back and on each side. This appliance embodies the important advantage of a hot air blast and also the very vital point of a durable construction. This question of durability of a hot blast appliance for soft coal fuel is one that has caused much annoyance and expense, and in this construction we have carefully provided for this important point. It is not a part of the combustion dome or fire pot, insuring equal expansion and contraction. The air is discharged into the combustion chamber directly over the surface of the fire and at a very high temperature, yet the construction is such that the combustion does not come in direct contact with it; the parts are allowed to expand and contract equally.

The New WALKER BOILER

for Steam: for Water

This boiler is especially designed to suit particular people. It isn't an ordinary boiler. The firebox is deep and roomy; will hold fire for ten or twelve hours without attention. This pleases people who don't like to get up in the middle of the night to shovel coal.

We believe in selling boilers by "honest measure;" for a 1000-foot job you buy our 1000-foot boiler; you pay for a 1000-foot boiler, and our 1000-foot boiler is plenty large enough to do the work, and a margin to spare.

Prompt delivery of catalogues or boilers.

DURABLE.

In the "NORMAN" Range are embodied up-to-date features that sell stoves.

The Fire Box is Oval in Shape and of Goodly Dimensions.

Either Duplex or Dockash Grates can be used. Grates removable through end door without removing any fire box linings.

Send for Illustrated Catalogue descriptive of our full line of Steel and Cast Ranges and Heaters.

GALUSHA STOVE CO., Makers, - ROCHESTER, N. Y.

DO you want to buy a good Number One, Medium Priced Range that will Roast and Bake with the best of them? If you do then do not be persuaded to buy anything but a

GEM-MILLER

STEEL-PLATE

RANGE

Which are far superior to other so-called first-class Ranges as to Roasting, Baking and Durability that are made.

WITH Improved removable Duplex Grate, Improved Water Back for heating water, Flue Lined with Pure Asbestos Board, New Non-Warping Oven Bottoms, Cold-Handled Gravity Latch, Drop Oven and Feed Door, Patent Double Centers, Regulating Damper, Nickel-Plated Towel Rod. All bright parts Nickeled instead of Polished. Nickel Bands on doors are ventilated to prevent tarnishing, and body of Ranges are highly finished.

Special attention is called to the easy manner of Removing and Replacing the Grates and Grate Frames in these Ranges without interfering with the Water Backs or Linings. Simply by taking out the small bolt and removing the Front Grate the entire Bottom Grate and Frame can be drawn out through the Front Draft Door.

BUY ONE AND BE CONVINCED.

Model Steel Range

For Hard Coal, Soft Coal or Wood.

They are **Models** of all the good things, useful and beautiful, that can be embodied in a modern range. Their popularity, on account of their many good points, has led many imitators to copy them as near as they dare, but as the oven doors, dampers, fire-box and other features are covered by patents, the imitations are still behind in the race, so far as construction and operation are concerned, and we feel confident that a comparison will result in a most favorable impression as to our claim that they are **Models of Beauty** and just the one range above all others that it will pay the dealer to handle. The large and constantly growing trade we enjoy on the **Model Steel Range** has been built up purely on its merits and not through a lot of extravagant "fake" advertising.

Write for prices and discounts.

The Stanton Seamless Heater, PORTABLE CASING.

The cut herewith represents the *Stanton Seamless Heater complete*, with portable casing. The inside Casing Sheet is made of No. 24 cold rolled sheet steel. The outside casing is made of No. 24 Aluminum-coated sheet steel, which is anti-rust and will stand a much higher degree of heat than it will ever be subjected to before tarnishing. Heavy asbestos paper is placed between inside and outside casing, which prevents heat from radiating into cellar. *This coating will not peel off*, but remain pretty and white.

Nothing Equal to It.

It was Goethe, you recollect, who declared that "to find some one who thinks as I do strengthens my belief." Well, here's what one individual who has thoroughly tested the

GURNEY

"Bright Idea" Heater

thinks of it: "My house is large and exposed, but I can heat the whole of it with the mercury at zero outside. I believe there is nothing equal to the 'Gurney' for heating a house."

If such testimony were rare, of course it would carry less weight, but when we assure you that we have on file hundreds of letters of the same tenor, it seems almost impossible for you not to comprehend the excellence of the "Gurney" Heaters.

But, having comprehended it, why not make use of it? Become our agent and then you'll share its benefits. For just so long as merit finds appreciation, just so long are "Gurney" Heaters bound to sell in increasing numbers.

WHEN you pay and your customer pays through you for some other Furnace twice the price we charge for the "DIGHTON," you are paying for theory, sentiment or imaginary value—paying for something that is of no real practical worth to you or to your customer.

The results secured do not begin to be in proportion to the expenditure—you have paid out more money than was actually necessary—you haven't got anything to show for the extra money you paid after five, ten or fifteen years—you haven't heated your house any more evenly or used any less fuel—you haven't obtained any better results in any way; probably not as good as your neighbor who has used a "DIGHTON." The chances are, your expenditure for repairs in fifteen years would be double what you would have paid out on a "DIGHTON."

Chicago Store, 169 Lake St.

KEWANEE, ILLINOIS.

FIVE HUNDRED DEALERS

in the United States have sold **RIVAL** furnaces for the past fifteen years and are selling them now. They have allowed other dealers to put in the **CHEAP WORK** and have given their customers

RELIABLE

FURNACES

wisely installed and thoroughly efficient in operation. Where **RIVAL** furnaces have been sold the general tone of a furnace business has been advanced to a higher level. Where they have not been sold the furnace business has been in disrepute. Dealers that have had an unsatisfactory business during the past year, have had

MUCH TROUBLE and LITTLE PROFIT

should consider that possibly it is owing to the character of the heaters they sell. We want good dealers to sell our furnaces, install them in a good manner, and good satisfaction will result with increased business at good profit. Our catalog illustrates and describes the line of heaters we make and on application we will quote right prices.

GIBLIN & CO.,
UTICA, N. Y.

WINCHESTER

How often success in man or goods is ascribed to "luck." We all know better. Intelligence, ability, diligence and merit make for success and not for failure. Do you suppose the "WINCHESTER" steam or water heater would have proved the success it has if it were merely "lucky"? Made by Smith & Thayer Co., Boston, Mass.

COMBINATION
WARM AIR
AND
HOT WATER.

50 Years of Heater Success back of that name.

Does it mean anything to you?

Magee Boston Heater,

"A" SERIES,

is for Warm Air Heating or for Warm Air-Hot Water Combination Heating. Thorough construction; hand puddled wrought iron used; gas tight; dust tight; sectional cast-pot or brick-lined; linings that last a lifetime; famous "dock-ash" grate; no shaking or sifting; no dead fire around edges of fire-pot; heats greatest amount of space with given amount of fuel; uniform, steady fire; easy to manage; and lots more advantages.

Six Sizes—three sizes for brick-setting.

The Best Test

of a furnace with reference to its heating power is the amount of space it will heat with a given amount of fuel under a proper state of combustion. We make the distinct claim for our

Magee Mystic Hot Blast Furnace

of superiority in this respect over any and all **cast iron** furnaces now on the market. **They're built to wear**, Six sizes. Return Flue Radiators, Either Solid Cast or Wrought Iron.

If It's a Question of Price,

or when a low-priced heater is wanted, specify, then, the

Magee Cottage Furnace

It isn't our **best** furnace, but it's a **good** furnace. It meets a wide range of requirements, but it doesn't perform miracles. We don't think there's as good a heater at as low a price. We wouldn't make one for less and you couldn't afford to handle it if we did.

Six sizes. Solid Cast or Wrought Iron Return Flue Radiators. High or Low Shield. Specially adapted to low cellars

Those matters which most vitally affect their operation, which make for success or failure, are ably treated in our catalogue,

SEND FOR ONE.

A 62-PAGE PAMPHLET

Comprising a Series of
Articles and Letters on
*Chimney Troubles
and Their Remedies*
published under the title

Contains a compilation from the col-
umns of THE METAL WORKER, of arti-
cles and correspondence relating to
house chimneys, defective flues, and
kindred topics, comprising a source of
information of the most practical and
reliable nature, on overcoming difficul-
ties which occur in the working of
chimneys, flues, etc.

To all who are interested in flues
and drafts, in their relation to
stoves, furnaces and house heating ap-
paratus, this book will prove instruc-
tive and helpful.

The Contents are as follows

	Page.
POINTS ON CHIMNEYS	7-32
An illustrated article by J. L. Bixby, Jr., describing many details in chimneys, which cause trouble, and giving remedies. An important table is presented, of the sizes of chimneys required in dwelling houses, based upon the amount of work to be done.	
DEFECTIVE FLUES	33-35
This article presents information result- ing from a wide, practical experience of the writer, and gives sound advice on some of the details of chimney con- struction.	
HOW TO IMPROVE A WEAK CHIMNEY	36-40
VARIOUS FORMS OF VENTI- LATORS or CHIMNEY TOPS	41-45
CONDENSATION IN STOVE PIPES	46, 47
SMOKE PIPE FOR WOOD FURNACES	48
REMEDYING DOWN DRAFT IN CHIMNEY	49-51
CONNECTED FLUES DESTROY DRAFT	52-55
FAILS TO BAKE ON BOTTOM	56-62

40 good Illustrations help
to make the Text clear.

Price, Postpaid 25c.

DAVID WILLIAMS CO.
PUBLISHERS
232-238 William Street, N. Y.

I can hold my hand over my chimney. No waste heat. I use a Rochester Radiator and save half the fuel.

THIS shows the construction of the **ROCHESTER** (stove-pipe) **RADIATOR**.

THIS has been advertised extensively for years.

THIS is the one your customers have frequently asked you about.

THIS is built like a steam boiler.

THIS has 9/10 of its radiating surface directly over the hot current, where every square inch of surface is as effective as six at the side.

THIS gives the results that have so surprised those who have used them and induced our patrons to do so much missionary work for us. Your patrons will gladly do it for you, if you give them the opportunity. Get a few started and after that they will almost sell themselves.

You Don't Know All About NEW ERA RADIATORS

Unless You Know:

1st. That they contain more feet of effective radiating surface than any other Hot Air Radiator made.

2nd. That there are no horizontal tubes to obstruct the draft.

3rd. That heat circulation is never sideways but always upward.

4th. That cool air is taken in at the bottom and heated as it passes upward, the natural, scientific way, thereby creating a rapid circulation of air that quickly equalizes the temperature in a room.

5th. That they are the most simple in construction.

6th. That they can be easily taken apart and cleaned or any of the parts can be replaced by simply removing three bolts.

7th. That they are very symmetrical in appearance and now have aluminum finished heads and bases, which greatly increases their attractiveness.

8th. That more heat goes up the chimney from a stove or furnace than is utilized in heating.

9th. That a New Era Radiator will save a large part of the heat that is otherwise wasted, thereby saving coal and increasing comfort.

10th, 11th and 12th. That these are real selling features, that you can make a nice profit selling them, and that it will pay you to send for our inducements at once.

Furnace Heating.

A Practical and Comprehensive Treatise on Warming Buildings with Hot Air, by William G. Snow, with an Appendix on Furnace Fittings. 170 pages; size, 6 x 9 inches. Cloth bound. Price, \$1.50.

This is the only book that has been brought out which presents a systematic and reliable treatment of the warm air furnace system of heating.

It deals with the various types of furnaces, their construction, proper location and setting, together with furnace fittings, and all matters pertaining to the installation of furnaces and to effective and economical heating by warm air. The subject is discussed for the first time by a competent author possessed of a scientific education and a practical training, who presents positive rules, based on a long experience, for guidance in designing furnace systems for dwellings and other buildings where this popular method is employed. The various details of furnace work are described simply and at such length that the volume will be valuable to all who are in any way interested in the subject. It is recommended to practical furnacemen, to architects, builders and house owners, and to tinnerns and plumbers in suburban sections who do furnace work. To all these it will prove a reliable text-book and guide.

PARTIAL SUMMARY OF CONTENTS BY CHAPTERS.

Chapter I.—Furnaces—Is devoted to Furnace Construction—The Relative Proportion of Furnace Parts—Secondary Heating Surface—Economy and Efficiency—Heating Capacity and Exposed Wall Surface—Manufacturers' Ratings of Their Own Productions, etc.

Chapter II.—House Heating—Compares Furnaces and other apparatus, and describes Method of Setting Brick and Portable Furnaces—Location and Area of Cold Air Supply—Cold Air Rooms and Air Filters—Return Ducts and Air Circulation—Size of Hot Air Pipes—Location of Registers, etc.

Chapter III.—The Combination System—Discusses Heating Distant Rooms with Radiators—Balancing the System—Location of Water Heater in Furnace—Capacity of Water Heaters—Size of Radiators, etc.

Chapter IV.—Air—Deals with the Necessity of Ventilation—Water Needed to Moisten Air—Expansion of Air—Velocity of Air in Tubes, etc.

Chapter V.—Heating and Ventilation of Buildings—Considers the Size of Furnaces Required—Fresh Air Room and Supply—Air Circulation—Size of Flues—Use of Stack Heaters—Size of Heating Coils in Vent Flues, etc.

Chapter VI.—Heating of Public Buildings, Churches and Stores—Is given to the Size of Furnaces Required—Grate Surface in Ventilated Buildings—Air Supply—Size of Heating and Ventilating Flues—Size of Stack Heater, etc.

Chapter VII.—Fan-Furnace Combination System—Is devoted to Positive Warm Currents from Fan Systems—Location of Fan and Driving Apparatus—How Good Furnaces are Aided by Fans—Types and Efficiency of Fans—Area of Ducts and Flues, etc.

Chapter VIII.—Temperature Control.

Chapter IX.—Estimate and Contract Blanks.

Chapter X.—Value of Fuels. The Proper Size for Furnace Chimneys—with tables.

APPENDIX.

Furnace Fittings.—A section of 45 pages dealing with the Making of Furnace Casings—Metal Cold Air Boxes—Making Furnace Bonnets and Collars—Making Pipe and Elbows—Register Boxes and Stack Shoes, etc.

Sent postpaid on receipt of price, \$1.50.

TIN LINED

IRON PIPE.

For Pure Water.

Avoiding without extra expense all
danger of lead or brass poisoning.

L. & R. PIPE.—Patented.

This lining cannot be torn from the
pipe even by bending or by hot water.

LEAD LINED

IRON PIPE.

Made the Same Way.

LAMB & RITCHIE, Cambridge, Mass.

THE No. 20 FIRE POT

is another step in advance
It is fitted with a brass
air pump, which is much
more durable than the old
style bulb. With this pump
a better air pressure can be
obtained, which intensifies
the heat and reduces the
amount of gasoline needed
to do a given amount of
work, and will therefore soon save its
cost in the saving of gasoline. The No.
20 Fire Pot bears the name of Clayton &
Lambert Mfg. Co., which means your
money back if it does not please. Your
nearest jobber sells them at factory price.
Cash must accompany orders sent to the
factory.

Clayton & Lambert Mfg. Co.,
Detroit, Mich., U. S. A.

Reducing Costs.

One secret of the industrial progress which is being made by this country and the success which attends its efforts to market its products abroad is found in the unremitting pains and marvelous ingenuity which are put forth to reduce the cost of manufacture wherever it is feasible, no matter how insignificant the saving thus effected. An illustration of this is given in connection with the management of the plant of one of the great consolidations who make it a constant study to reduce in every possible way the cost of turning out their product, watching with scrupulous care every detail of manufacture. The manager of the mill observed that in the course of manufacture a certain line of goods were laid down again several times, involving obviously the necessity of taking them up again. To this evident waste of labor the attention of the men in charge was called that they might study on the question as to the way in which it could be avoided. As a result of this a number of bright practical men are grappling with the problem thus presented. It is not to be supposed that it will be found feasible to do away altogether with waste of this character, but some modifications of method have been already adopted which will result in slightly diminished costs. The same principle might doubtless with advantage be considered carefully and in a practical manner by many manufacturers.

A similar economy might be practiced in many a manufacturing or mercantile office in connection with the conduct of the business. Some may be surprised to know that a great corporation, whose profits under existing circumstances are very large and who are abundantly able to be extravagant, should practice careful economy in every department. Not long since on looking over the clerical force in a certain city where ten or twelve men were employed it was decided that one of them could be spared, the remainder being sufficient to take care of the work of the office. Accordingly the manager said he was given the unpleasant task of telling one of the clerks, a very satisfactory and observing young man, that his services were no longer needed. He was dismissed with a month's pay in advance to give him an opportunity of looking up another place. In this way a permanent saving of more than \$60 a month was effected, with, at the same time, an improvement in the efficiency of the whole force.

Bearing on this subject is the recent remark of a prominent and successful merchant that there is more

need and more opportunity for bright and able men now than ever before in his experience. They must be of such a make up that they fall in with the changing conditions and movements, and are able to think out new lines of work or to direct with special efficiency, so that labor is minimized and the greatest results obtained at the smallest expense.

Plumbing Trade Relations.

Evidence is manifested in the correspondence presented on another page of a strain in the relations which have existed for more than a year and a half, with profit to all, between the members of the National Association of Master Plumbers and the National Committee of the Confederated Supply Associations, through the working of the New York Conference Resolutions. It seems that it has been found impossible for the supply associations to satisfy all the demands of the master plumbers, although their good intentions have been shown in the recent appointment of an additional sub-committee to give special attention to the complaints brought to the attention of the Arbitration and Joint Conciliation committees. That there are some members of both associations who cannot be held by their rules and agreements is the cause for the abrogation of the New York Conference Resolutions, so far as they provide for arbitration and joint action in case of disputes and infractions. The law of the Medes and Persians cannot always be applied, even though a violator may be persistent and defiant. It was an open secret that matters were not altogether satisfactory, even during the conservative administration of ex-President Tierney, and that they have become irksome is shown by the action of President Hornbrook and his Executive Committee in issuing an open letter to the manufacturers and jobbers of plumbing goods giving the correspondence which led up to the abrogation of the objectionable sections in the resolutions. This letter was accompanied by a copy of the new Cleveland Resolutions, adopted at the meeting of the Executive Committee of the National Association of Master Plumbers recently held at Cleveland, Ohio, which are said to be practically the same as the old resolutions with the troublesome provisions eliminated.

Destruction of Street Mains.

Wherever the convenience of electrical street car transportation is enjoyed the destruction of city and private mains carrying gas and water has been noted. In many instances the action of electricity on these pipes has continued without any attempt to apply a remedy. It is pointed out by the authorities of Washington and some other cities that this destruction can be largely avoided by the addition of a second trolley wire to the system in use. Electricity necessary to operate the cars is sent out from the power house on a carefully constructed line composed of copper wire of ample size, regardless of the expense. It is necessary that this electricity, after passing through the motor running a car, shall be disposed of, and benefit is derived when this electricity is brought back to the power house. Some effort is made to this end by bonding the street cartracks by means of a copper wire. Here, however, the diffi-

culty arises of making a suitable and permanent connection, and economy in the size of the wire has left the electricity to return to the power house or not, as the case may be. In consequence, a large portion passes through the earth to the gas and water mains and other branches which belong to the city or to corporations or private owners. It has been demonstrated that where a second trolley wire is used this destruction is largely avoided.

The destruction of the gas and water mains by trespassing or vagrant electricity is held to be a violation of the rights of others. At a recent meeting of the Central States Water Works Association, at Evansville, Ind., the city solicitor of Dayton, Ohio, said that his city was about to take action through the courts against a street railroad company who had erected lines that caused destruction to cast iron, wrought iron and lead pipes in a few months, where, previous to the advent of the electric line, such pipes had stood the test of years unimpaired. In his argument he pointed out that no one would permit the waste water from a water power to run across his land, doing damage, without an action to recover. It is held that a company operating electric lines in various parts of the United States have no right to allow the electricity which has once been used to flow out so as to inflict damage upon others without being liable for actions to recover damages. This brings up a very interesting question. There is a strong probability of persistent litigation to avoid responsibility, and it is improbable that this question will be decided in the first court in which it is presented.

Practical Philanthropy

Probably no agency for the elevation of the boys of the crowded east side of New York City is of more practical value than the evening trade school connected with St. George's Episcopal Church, to the work of which reference is made in another part of this issue. Starting about eight years ago with a handful of boys on a single floor of a tenement house, it has grown until it now occupies the whole of a five-story building, while so great is the demand upon the advantages offered by the school that it has become necessary for the directors to limit the attendance of each pupil to two evenings a week, so as to give the hundreds of students a chance to reap at least a portion of the benefits it confers. Primarily a kind of club designed to bind the boys together, amuse them and keep them off the streets in the evening, the school has now become an important factor in their lives, affording them the means of becoming eventually skilled mechanics earning good wages, and useful and self respecting members of the community. As the boys who attend the school are drawn mainly from the class of very poor families that inhabit the part of the city in which it is located, the entire tuition is given without charge. Thus valuable instruction is placed within the reach of boys who could not possibly afford to pay for it.

This is a form of practical philanthropy which might be followed elsewhere with great advantage to the community at large, and to the boys who reap its benefits in particular. The public spirited and benevolent men who conceived and started this valuable branch of the work of a great working city parish probably builded better than they knew. In helping the boys to help themselves they are providing them with the best kind of equipment for making a success of life. No claim is made that the school turns out skilled mechanics, but it does impart to its pupils sufficient training to enable them to choose intelligently the trade they would like to master,

and to give them advantages of mechanical education superior to those which ordinarily are obtained among the employees in workshops. No development is to be more desired than the multiplication of such practical institutions for the benefit of the younger generation, especially where, as in this case, the boys are unable, through poverty, to obtain the trade training offered by such institutions as the great New York Trade School and other establishments of the kind, where the payment of a fee, however small, places their advantages out of the reach of such as those who inhabit the congested tenement house district in which the St. George's School is located.

Uniformity of Prices for Raw Material.

A somewhat threadworn argument is marshaled in line by those who are eager to prove that 17 cents is a satisfactory price for copper. We are gravely assured that the manufacturers who use the metal as their raw material do not object to that price, nor, in fact, to any price, so long as it is stable. We are advised that the one overpowering desire of the manufacturer is uniformity and regularity of values, that he sighs for the times when his raw material shall not show fluctuations in prices, because then he may dismiss the perplexing questions attending his purchases and devote his untrammelled energies to his natural field, that of manufacturing goods. It is urged that to a considerable extent uniformity in prices of raw material involves, too, absence of variation in the prices of manufactured goods, and that this, too, is in the direction of an ideal condition for a manufacturer.

It would be idle to deny that this plea, uttered by the sellers of the crude product, is echoed freely and frequently in manufacturing circles. Yet it looks dangerously like a confession of weakness. A manufacturer is and must be more than a converter and shaper of raw material. He abdicates important functions, big with the possibilities of profits, when he abandons the hope and the ambition to purchase to better advantage than his rivals and thus loses opportunities. Every manufacturer must be in some degree a merchant. When an industry reaches the point that its leaders profess their willingness to sacrifice the chance of buying to good advantage for the sake of peace of mind, then that industry carries the seeds of decay.

Teaching Languages by Mail.

Instruction by mail in almost every department of knowledge, aside from the purely academic subjects, has been carried to a high degree of perfection by the International Correspondence Schools of Scranton, Pa., and the efficiency of this method of education has been fully proved by the successful results achieved by the pupils of the institution. The latest department of instruction recently added to these schools is among the most interesting as displaying a remarkable adaptation of modern mechanical facilities to the work of teaching. A complete course in modern languages is being given by mail. At the first blush it would seem scarcely possible to thoroughly impart such instruction, involving the niceties of pronunciation and idiomatic construction of a foreign tongue, otherwise than by word of mouth and in the presence of a teacher. But this difficulty has been surmounted with the aid of the phonograph. In addition to specially prepared instruction papers, spoken words and exercises are sent to the student and repro-

duced through the phonograph, while words and exercises are spoken by the student into the phonograph and sent to the schools for correction and criticism. Thus the pupil is enabled not only to learn to read and write in French, German or Spanish, but also to speak those tongues with correct accent and expression. This method seems to be the perfection of convenience. The student does not have to sit for an appointed time with his teacher, whether he feels like listening to him or not. He has his phonograph and records with him always, and can study when and where he pleases. The claim is made that more progress can be made in six months' study by this system than in the same length of time spent abroad, with the added advantage of obtaining the knowledge at a comparatively small cost. To the young man embarking on a business career familiarity with a foreign language is a valuable asset in these days when our commercial relations with foreign countries are constantly growing more important. Comparatively few young men can afford the time or the money needed to study foreign languages abroad, whereas instruction such as that provided by the correspondence method is within the reach of many. The conspicuous success attained by the Germans in the extension of their foreign commerce has been due largely to the fact that so many of their young men familiarize themselves with foreign languages, and are thereby enabled to come into closer touch with customers in other countries than they could if ignorant of their language. It is time that the business men of the United States gave more attention to this essential point in the cultivation of foreign trade.

Editorial Notes.

Probably the American wage earner has never received relatively higher wages nor had better prospects for a steady continuance of employment than at the present time. Recent labor reports show that the number of unemployed workers is remarkably small, while advices from all industrial centers indicate that the outlook for uninterrupted operation of mills and factories through the winter and spring was never brighter. The fact that most of the strikes and labor disputes of this year have turned on the question of hours of labor or the recognition of labor unions rather than on grievances connected with wages illustrates the favorable pecuniary conditions which labor has been enjoying during the opening year of the twentieth century.

The tide of prosperity which this country is experiencing naturally has been accompanied by an increased immigration. Official statistics recently published show that nearly 20 per cent. more immigrants landed here during the last fiscal year than in the preceding one. Nearly one-half of the foreigners who came in were Italians, Hungarians, Slavs and Poles, one-third of the total immigration being composed of Southern Italians. Under these circumstances it is not surprising to learn that of the 388,931 persons who were permitted to land 107,323 were illiterates, a much larger proportion than ever before. This is to be regretted. While there is always room and a welcome in this country for desirable immigrants who will make useful citizens, the influx of ignorant foreigners of a low class is not to be desired. It is likely that the next Congress will take steps to revise the immigration laws, so as to prevent the country from being overrun by an undesirable class of immigrants.

The Washington Stove Dealers' Association.

An organization of the stove dealers of Washington, D. C., was formed more than a year ago and is now in successful operation. The trade will be interested in the information given below in regard to the lines on which it is working and what it has accomplished for the benefit of the trade. In this connection we take pleasure in laying before our readers the following letter from the president of the association:

WASHINGTON, D. C., October 21, 1901.

To the Editor: I have observed with pleasure mention in *The Metal Worker* of a disposition being manifested by retail stove dealers to organize throughout the country for mutual trade protection. That the stove dealers in every city should organize for the purpose of obtaining and preserving trade rights is beyond question. No city in the United States is more in need of protective trade associations than our Capitol city.

Realizing the necessity of an association, a few of our stove dealers endeavored to effect an organization about two years ago. The conditions existing at that time between wholesale and retail dealers were as follows: 1. Jobbers bought goods at a lower price than the retail dealers to enable them to sell to the retailers at a profit. The jobber utilized his advantage to undersell the retailer and sold goods to the consumer at the same price as he sold to the retail dealer. This procedure caused the consumer to demand goods of the retail dealer at the same figures as sold by the jobber. The jobber thus established a low rate of prices, with which the retailer could not compete.

2. Manufacturers sold, and do sell, stoves, furnaces, &c., direct to architects, builders and consumers, thus competing with their retail customers. 3. A few manufacturers who did not retail goods sold to jobbers at a lower rate than accorded the retail dealers and the jobbers sold direct to the customers of the retailers. People went to the store of the retail dealers, examined such stoves as required and then purchased the goods from the jobber, who carried no stoves in stock; the jobber making the sale at the expense of the retail dealer.

A short time ago a stove dealer purchased a line of stoves and ranges and had the manufacturer apply a new name to each of the stoves as protection against the avarice of the jobber. The sagacious jobber ascertained by whom the stoves were made and informed a customer of the stove dealer that he could furnish the same stoves for less money than sold by the retail dealer. As the jobber could not secure the stoves from the manufacturer he evidently intended to purchase them indirectly, a proceeding which can be remedied only through a national organization.

The work of our association to date, while beneficial, is far from satisfactory. Jobbers still continue to sell goods to consumers and deal in stoves, ranges and furnaces to the detriment of the retail dealer.

Inclosed you will find a circular letter, a copy of which was sent to every stove dealer in Washington in an endeavor to secure the co-operation of all concerned.

Also inclosed is a copy of an agreement between our association and a Washington firm who, at present, constitute all the jobbers, in their line, in our city. The character of the agreement will convey to your mind the "grip" which the Washington jobber has on the retailer. This agreement will terminate January 1.

Our association has been discussing the question of a national association, and we think steps should be taken at once toward organization. I know of no better medium for bringing the stove dealers in communication on the subject than *The Metal Worker*. This is the age of organization, and the individual who, in business dealings, has the influence of a strong association, is treated with much more consideration than is accorded a single personality. And as the influence of a local association benefits the individual, so the prestige of a national organization benefits the local association.

Washington is conveniently located for a convention

of Eastern and Southern stove dealers. January would be a good month for a meeting.

These suggestions are for the purpose of inviting opinions of those interested as to the best plan for effecting a national organization. Communications addressed to the writer will be presented to the next meeting of the Stove Dealers' Association of the District of Columbia, which will occur on the first Wednesday in November.

Very truly,

F. S. HODGSON,

President Stove Dealers' Association, Washington, D. C.

AGREEMENT BETWEEN THE JOBBERS OF STOVE REPAIRS AND THE STOVE DEALERS OF WASHINGTON.

We give below the substance of the agreement with the stove dealers of Washington which has been made with the principal jobbing house of that city, as referred to in our correspondent's letter above. The circular letter relating to this matter naturally divides itself into three parts, the first reciting what the jobbing house agrees to do in its relation to the trade; the second covering the agreements of the Stove Dealers' Association in regard to the purchase of repairs, and the prices at which they will be sold, and the third covering provisions to secure the carrying out of these agreements through the Investigating Committee. The essential parts of this circular are as follows:

To the Stove Dealers' Association of Washington:

In consideration of the stove dealers of Washington agreeing to purchase all their repairs for stoves (except repairs for such stoves as they may be agents of the manufacturers for) from Rudolph, West & Co., the said Rudolph, West & Co. agree:

FIRST.—To sell to the legitimate trade—i. e., to parties engaged in the business of selling or repairing stoves and having an established place for the conduct of said business—repairs as follows:

BALTIMORE AND PHILADELPHIA MAKES.

(Bartlett, Hayward & Co., B. C. Bibb Stove Company, Chesapeake Stove Company, Abram Cox Stove Company, Keeley Stove Company, Leibrandt, McDowell Stove Company, S. B. Sexton & Son, I. A. Sheppard & Co., A. Weiskittel & Son and Wm. E. Wood Company.)

Basket grates.....	} 5 cts.	Grate rests.....	} 7 cts.
Magazines, heavy.....		Oven plates.....	
Fire pots.....		Oven racks.....	
Sexton's furnace repairs.....		Sifter grates.....	
Fire plates.....		Fire plates.....	
Sexton's r'ge and lat. grates..		Light grates.....	
		Covers.....	
		Cross pieces.....	

NEW YORK, PENNSYLVANIA AND SOUTHERN CASTINGS.

(Boynton Furnace Company, Buckwalter Stove Company, Danville Stove Company, Graff & Co., Lebanon Stove Works, W. J. Loth Stove Company, Orr, Painter & Co., Raymond & Campbell, Richardson & Boynton Company, Richmond Stove Works, Syracuse Stove Company, Thomas, Roberts, Stevenson Company, Union Stove Works and Yeager & Hunter.)

Fire pots.....	} 6 cts.
Flat furnace grates.....	

All other castings sold by the pound at 7 cents.

Terms: Net; longest term of credit not to exceed 30 days.

SECOND.—To in no way solicit or encourage retail business to come to them. When compelled to sell to consumer to charge not less than 11, 12 and 13 cents per pound for repairs, being an advance of 6 cents per pound over trade prices, and to sell bricks at not less than \$1 per set.

THIRD.—To at all times afford the Investigating Committee, hereinafter provided for, every facility for investigating violations of foregoing stipulations.

FOURTH.—To aid the stove dealers of the District of Columbia to maintain the prices they agree to sell at by assisting the association in getting the entire trade of the District of Columbia to become parties to this agreement, and any other legitimate means.

The members of the Stove Dealers' Association of the District of Columbia, and such other dealers whose signatures may be procured to this agreement, agree, in view of the foregoing concessions made by Rudolph, West & Co.:

FIRST.—To buy all repair for stoves, except the repairs for such stoves as they may be agents of the manufacturers for, from the said Rudolph, West & Co.

SECOND.—To sell at retail heavy casting (grates and fire pots) at not less than 10 cents per pound; light cast-

ings (cross pieces, covers, oven plates, &c.), at not less than 12 cents per pound, and bricks at not less than 75 cents per set.

THIRD.—To state, in writing, when signing this agreement, the name of the manufacturer for whom they are agents and for whose stoves they desire to continue to order repairs direct from said manufacturers.

It is mutually agreed by said Rudolph, West & Co. and the signers of this agreement:

FIRST.—That a committee of five be appointed and known as "The Investigating Committee," with full power to take evidence and decide whether or not the signers of this agreement have violated the provisions thereof; and that their finding shall be final and without appeal.

SECOND.—That a penalty of \$5 for each of the first three violations of this agreement be due and payable to the said Stove Dealers' Association of the District of Columbia immediately on the report of the Investigating Committee that a signer has been found guilty of violations of this agreement. After being found guilty three times the said signer's name shall be stricken from the agreement. The money collected from violators to be placed in the treasury of the Stove Dealers' Association of the District of Columbia.

THIRD.—That the said Rudolph, West & Co. shall have one representative on the said Investigating Committee.

FOURTH.—That all violations of this agreement coming to the knowledge of signers be reported with the utmost promptness to the chairman of the Investigating Committee.

FIFTH.—That this agreement go into effect at once, and remain in force for one year from date.

Approved March 13, 1901.

WHAT THE ASSOCIATION HAS ACCOMPLISHED.

Under date September, 1901, a circular was issued by F. S. Hodgson, president, and J. A. Pierpoint, financial secretary, in which a condensed statement is made of the purposes of the association and what it has thus far accomplished. It will be observed that reference is made to the very unsatisfactory condition of things existing before the organization of the association, and the steps which have been taken to correct the evils complained of. There is little doubt that similar evils exist in many cities and towns and the efforts made by the trade in Washington will be regarded with special interest. The substance of the circular is as follows:

We respectfully submit for your earnest consideration a summary of part of the work accomplished by the Stove Dealers' Association of the District of Columbia.

By social and business intercourse dealers of the association have eliminated unfriendly competition which formerly existed as the result of efforts on the part of customers to incite one dealer against another for selfish motives.

Mutual advantage has resulted from the discussion, from time to time, of important questions relative to business interests.

The first important work of the association was obtaining a modification of the plumbing regulation which prohibited stove men from connecting ranges with boilers. The association, through a committee, was instrumental in having amended the plumbing regulations so that dealers in gas ranges were given the privilege of connecting gas ranges with gas fixtures in buildings. The fact that arrests and convictions of stove men for violating this law have been made attests the importance of the change to all dealers and emphasizes the value of organization.

The question of ruinous competition between the jobber and the retail dealer has been thoroughly discussed and disposed of, for the present, to the satisfaction of all concerned. Jobbers have been induced to advance the price of stove brick to the consumer from 50 cents to \$1.

The rates for castings per pound have been raised to 11, 12 and 13 cents. The beneficial results effected by these changes in prices have been attested to by almost every member of the association.

The association has taken effectual action in behalf of individual members who have submitted to the association personal grievances for adjustment.

There are many other questions of importance which require the united action of every dealer in the stove and tin business in the District of Columbia.

The association desires to have the name of every one legitimately engaged in the stove and tin business enrolled as a member.

As every dealer, whether a member or not, has been benefited by the work of the association, those not members are, to some extent, in duty bound to apply for mem-

bership. This is the age of organization, and the individual without the prestige of an association does not receive the consideration due him, a fact that has been exemplified by the experience of stove dealers in the courts prior to the advent of the Stove Dealers' Association.

Better Furnace Work.

BY A. J.

Architects and builders, as well as their customers, have noted the fact that during the past year or two hot air furnaces have been used for heating some of the largest and finest residence buildings that have been erected in different parts of the United States. This is substantial encouragement to those furnace men who have stood stanchly in defense of good furnace work, and who have insisted upon doing it and securing the price that such work is worth. I make this statement in order to bring to the notice of furnace men generally the fact that furnace work has not lost prestige in competition with the other systems of heating, and that it is the duty of every furnace man to study methods and use his energy to secure a more general use of a better class of furnace work.

I have no hope of securing now or at any time in the future a millennium for hot air furnace men. They will always have competitors to contend with, who are too ignorant to know how to do good furnace work, either in the details of workmanship, or in putting up the furnace, to say nothing of that knowledge of the movement of air currents and the effect of the outside atmosphere, which must be understood in order to lay out furnace work as it should be done. The annoyance caused by these men can be alleviated by rendering them such assistance and such encouragement in their efforts as they are capable of receiving.

There is another class that have all the gray matter necessary to do first-class work, but who are thoroughly mercenary and are only anxious for what money they can get out of their work. These fellows are more difficult to deal with, but that is no reason why missionary work should not be conducted among them.

READY TO IMPROVE.

The great multitude of furnace men, however, are honest and ambitious, and willing to do better when they know what is better. These men form the great majority, and it is among them that the intelligent and progressive furnace man and the furnace manufacturer should labor to improve the general character of work. Some of these men are good workers, and their work in detail is above reproach, but in many instances they do not understand how to determine the heating capacity of a furnace or the heating values of different styles of construction. Nor do they understand the size of heaters, the sizes of pipes for hot air supply or the vent ducts required for heating different classes of buildings. To assist these people by giving them information on the points in which their knowledge is deficient would be to remove, in many instances, a disagreeable competitor from the field. Men who do not know the difficulty of heating a building will agree to heat it for less money than would a more competent man. If they secure the contract either they will lose money, or, if they are paid before their heating systems are thoroughly tested, the building cannot be heated in extreme weather, and furnace work gets another black eye. •

PROTECTION FROM OPERATIVE BUILDERS.

There is still another class of furnace men who need assistance, and they are the men who do good work, both in designing and in construction, but who need a little business training in order to avoid being made use of by shrewd building operators. The building operator of this character is ever on the lookout for some competent man who is willing to take a contract for heating a large number of buildings at a very small margin of profit. The building contractor knows that these buildings will not be ready for the furnace man so that he can do his work with advantage to himself and keep the cost

within the figures at which he has estimated. He knows that some of the buildings will be ready at one time and some at another, and that as the construction progresses the furnace man will be called upon to complete his work at a sad disadvantage to himself, which will result in the loss of no small amount of time and labor, and may finally eat up the expected profit until an actual loss takes its place. If it was possible to educate all the furnace men so that they would know better than to take contracts of this character at the low prices set by the building operator, the work could be made to pay a profit to those who do it, instead of being the means of embarrassing the contractors by an eventual loss.

Another source of discouragement is that even though a large contract of this kind may be carried out without actual loss, there is really no profit in it, for often the small contractor has allowed his small custom trade to be disappointed and scattered, while his whole energies were concentrated on one big contract. Thus he is sure to suffer a loss from having taken up the big job.

PROGRESSIVE SHOP METHODS AND EQUIPMENT.

Then there are shop methods and details of construction which enable some shops to produce furnace drums, casings, pipes and fittings at a far lower price than the small shop with a limited equipment of tools. Usually the men who do the high grade furnace work which is used in handsome residences have the best equipped shops, and if they engaged on contract work, with their better equipment and better business experience, they could eventually secure a better profit from such work than the smaller and less favored contractors would make out of it.

POOR FURNACES HURT THE TRADE.

In many instances furnace manufacturers make, in addition to their good furnaces, some hot air furnaces that are sold at such extremely low prices that it is impossible to conceive that they will pass through even the first season without becoming greatly impaired. The sale and use of such furnaces result in a dissatisfaction with hot air furnace heating, which is reflected along the whole line of hot air furnace work. At the outset I pointed out that some of the handsomest residences that have been erected in various parts of the country were heated with hot air furnaces. I recognize that where there is one of this class of buildings erected, there are hundreds and even thousands of the cheaper class. I would point out, however, that that is no reason why the cheaper class of buildings should not be equipped with a hot air furnace of good construction, such as would be durable in use and economical in operation.

To secure reform some co-operation will be needed between furnace men in all the larger cities and in adjacent country towns. The men who do first-class work must meet and discuss and explain to their less well informed brothers some of their methods. No doubt many men who do first-class work will be more or less reluctant to explain their methods to some men who they feel certain will utilize the information for cutting into their trade and thus become a greater nuisance to them than they are without this assistance. However, in all attempts at elevation of morals or methods sacrifices must be made, and in the end benefit will come. There is no better way of helping the furnace trade than in discussing methods for improving its condition. Those who can write and describe their ways of doing work, their methods of making contracts, of selling heating systems, and of collecting bills will no doubt find *The Metal Worker* open to their contributions for the benefit of others in the trade.

GEORGE B. DONAVIN & Co., Columbus, Ohio, are distributing among the Stove trade an eight-page pamphlet devoted to their Double Action Gas Heating Stoves. The Stove is oblong in shape, having air tubes run through it from top to bottom back to the asbestos reflector, which is behind a very prettily designed illuminating front. The products of combustion rising from the flame must assume an indirect passage, caused by suitable baffle plates, before they find outlet at the back, the stove being designed for a chimney connection.

THE NEW YORK STOVE TRADE.

This week gave the first evidence around Beekman and Water streets, New York, that the stove season had about reached its high. In addition to the usual number of trucks used for the delivery of stoves and repairs to the transportation companies, a number of wagons of dealers from the outlying suburban districts were to be seen, as well as those from nearer the center of the city. The faces of many out of town dealers were also observed hurrying from one stove house to another on matters relating to some special information, repairs or goods needed in their business. This is a healthy sign of the trade, and it is further substantiated by the fact that stocks of many lines of goods in the warehouses have been exhausted, and the present supply represents the every day hand to mouth production of the foundries. It seems, moreover, that this condition is not confined to stoves alone, for the furnace branch of the trade is also enjoying a good run of business. A notable feature in the New York trade is the increased sale of oak stoves, and a transfer of the demand from the high priced square parlor stove to this new, popular favorite.

Many of the manufacturers are satisfied with the trade that is being done and attribute the fact that good prices are being secured on many lines largely to the work done in the association, which has met periodically at the Astor House for the past year and a half. Nevertheless, there is no hesitation in the expression of the opinion that too many goods are sold at lower figures than could be secured if a little more backbone was possessed by some who are eager to dispose of their stock. Naturally, while the manufacturers are so busily engaged with the regular rush of business at this season, it would be difficult to secure a proper representation at a stove association meeting. Yet, in view of the fact that there is evidence of a need of a reform in the matter of concessions, it is evident that time could be well spent at a meeting held for the purpose of discussing the prevailing conditions and forecasting the future with a view to reaching an agreement as to the course that would be most profitable, provided it should be followed in a measure, if not entirely, by all who are most closely interested.

Born Steel Ranges.

A neat pamphlet of 24 pages, known as Catalogue No. IX, has just been issued by the Born Steel Range Company of 122-126 Superior street, Cleveland, Ohio. It is devoted exclusively to Born steel ranges for family use, and in the early pages the essential features of construction are described at considerable length. The statement is made that one continuous plate constitutes the back and both sides of the stove, while another forms the front, so that there are but two joints on the outside, both of which are made air tight. The end walls and those around the fire box and reservoir are of double thickness, with an interlining of asbestos board. The sides and top of the steel oven are extra heavy, shaped from a single plate, flanged at the front and back and closely riveted to the walls. The company refer to the fact that the shape and thickness of the patent removable oven bottom is proof against warping, cracking and burning out. It is level and smooth and so clamped and braced in position as to be easily taken out, if necessary, without damage to the range. The drop door is of steel inside and planished iron outside, and has either a smooth malleable iron frame or an ornamental cast frame polished and nicked, as may be desired.

The company state that in all the sizes, except the 100 Series, the coal grate can be reversed for burning wood, while a locking device on the front keeps it from dropping back. In the 100 Series the grates draw out through the front. The flues are proportioned to the fire box and constitute an extended combustion chamber, having the effect of heating all parts uniformly and reducing the amount of fuel required. Another feature to which attention is particularly directed is the cast iron flue, which, it is stated, will never rust nor burn out. The Born is shown in a number of styles and sizes

adapted to meet varying requirements. In connection with each style is presented a table giving the sizes in which the stove is made, the dimensions of the oven and top surface and the prices. Several pages at the close of the catalogue are devoted to extras, such as water fronts and backs, attachments, grates, &c.

The National Draft Regulator and Radiator.

We illustrate herewith the National draft regulator and radiator that is being manufactured and placed on the market by Sprecher Bros., Ephrata, Pa. This device is claimed to be built on scientific principles so as to radiate the heat outwardly and circulate the air in the room upward through the interior of the radiator. The corrugated sheet iron casing is inclosed, top and bottom, by a suitable cast iron head and base, and incloses an inner circulator attached to the heads, the latter being supplied with ducts and inlets so arranged as to give perfect circulation without checking the draft. The casing and head are held together by suitable lugs, no bolts or rods being used, the radiator can therefore be easily taken apart for cleaning or repairs, which, if nee-

The National Draft Regulator and Radiator.

essary, can be done by any tinsmith at a trifling cost. The National draft regulators and radiators are made for use in connection with Oak or oval wood stoves, as well as ranges, furnaces or other heaters of any description, and can be used in connection with anthracite or bituminous coal, coke, wood or any other fuel. The claim is made by the arrangement of the draft regulator in the bottom head, a large percentage of the heating power of the fuel can be utilized and held in check and the fuel be entirely consumed with a material gain in available heat in the room. Sprecher Bros. furnish these radiators with single or double cylinders, and with various styles of heads and bases.

Concerning Gasoline Stoves.

One of the leading manufacturers of gasoline stoves brings up some very interesting points in connection with the condition of the gasoline stove trade. Gasoline as a fuel, he claims, is getting scarce, and the hope for extending the supply is small. The uses for gasoline have been enlarged very materially of recent years, and the demand for its use in operating engines, automobiles, boats, &c., coupled with the requirements of the numerous makes of stoves, seems to indicate that the fuel will be more expensive.

In the gasoline stove line, as in others, the popular idea seems to be to get a cheap article, disregarding the fact that a stove burning gasoline has to stand very severe usage, and unless constructed of the best grade of materials its lasting qualities are sacrificed. It is cited

as a strange circumstance that a great many of the up to date dealers will stock up with a cheap line of these goods, on which there is an extremely small margin of profit, whereas the standard makes of goods, which will outwear the others and give general satisfaction and will net the dealer many per cent. more profit, do not find a place in his stock.

The Real Economy Gas Range.

One of the recent additions which have been made to their line of gas ranges by the Economy Stove & Mfg. Company, 23-27 Brush street, Detroit, Mich., is known as the Real Economy, a general view of which is presented herewith. These ranges are made for both artificial and

The Real Economy Gas Range.

natural gas; those using the latter fuel being fitted with closed tops and heat covers and having an independent vent for each burner. Special attention is called by the manufacturers to the fact that this gas range has an elevated oven and broiler and a visible oven fire, emphasis also being laid upon the fact that the range can be operated from a standing position, thus avoiding the necessity of stooping. The oven is lined with asbestos and fitted in the bottom are removable polished cast iron cake griddles, which are referred to as being rapid and economical bakers. The burners have drilled perforations and are removable for cleaning. Each range also has one giant burner and one simmering burner in addition to the regular burners. All are removable for cleaning and all mixers are adjustable. The broiler is located at a convenient height and is heated with the regular oven burners, both oven and broiler being removable. The range can be furnished with either lever or needle valve, and all the burners are visible from a standing position. The illustration which we present herewith represents

the four-burner plain range and, with main top including end shelves, measuring 28 x 40 inches. The height of the main top from the floor is 27 inches and the height of the oven shelf from the floor is 44 inches. The body of the stove is attractively enameled, thus rendering it rust proof and at the same time easy to clean.

Marriage of Edwin S. Barbour.

The Fort Street Presbyterian Church of Detroit, Mich., was the scene, on Tuesday, October 15, of the marriage of Edith Henry, the only daughter of A. M. Henry, to Edwin Scott Barbour, son of George H. Barbour, vice-president and general manager of the Michigan Stove Company. Mr. Barbour, Jr., is a director of the company and also the purchasing agent. The wedding was of more than ordinary interest, owing to the social prominence of both the bride and bridegroom, and the ceremony was witnessed by a large congregation. The marriage was performed by the bride's uncle, the Rev. Dr. James Buckley of Morristown, N. J., assisted by the Rev. Edward H. Pence, pastor of the church. The decorations of the church were particularly beautiful, being of autumn leaves and branches arranged in front of the galleries and altar. Back of the autumn boughs in front of the pulpit was a bank of palms, with three marriage bells in white flowers. The bride and groom left for the Berkshire Hills in the private car of President Ledyard. They will also visit other points of interest, returning to Detroit early next month.

The Satisfaction Steel Range.

The Michigan Stove Company, since the issuance of their last catalogue and price book, have completed patterns for the Satisfaction steel range, designed to be sold at a popular price. A handsomely illustrated circular describing this range has just been received. It is of full sized cabinet construction, has a square steel oven with the bottom braced to prevent warping, a heavy duplex grate, heavy sectional cast linings which fit all sizes, steel oven door which is counterbalanced, the oven top protected with a cast iron plate, front feed or broiler door, front draft, ventilated oven, extension fire box for wood, effective ash guards, steel ash pan, large flue cleaning door and end shelf on the square range. The inside of all flues is aluminized, which prevents their rusting. The oven racks, the back of the oven, the inside of the oven door, the fire door, the ash pit and oven doors and the front damper are also aluminized. The range is furnished with a very attractive high shelf and high closet, having aluminized trimmings and a revolving sheet steel door. In constructing this range, the manufacturers have made the wearing parts exceptionally durable and have also designed the range as to make it an easy construction to handle. It is further designed to be economical in the use of fuel. By means of the new portable reservoir, which fits all sizes, a range can be changed in a moment into a square and reservoir stove. The reservoir has flush top, is made of galvanized iron and is aluminized inside and out, with japanned cast iron covers.

Stove Dealers' Supply Catalogue.

Kramer Brothers, proprietors of the Dayton Stove Repair Works, Dayton, Ohio, issue a 52-page catalogue devoted to the hardware specialties, stoves and stove repairs which they manufacture and to a variety of supplies for the stove dealer, which they also handle. The first pages of the catalogue show two styles of sheet iron, coal and wood air tight stoves and two styles of cast iron globe cylinder stoves, adapted for school houses, halls and factories. The firm's line of specialties includes street manholes, sewer basins, street gutters, crossing plates, bell traps, cistern covers, furnace door frames, stove pipe dampers, drum feet and stove pipe shelves. They also make cast iron flower vases, lawn settees and fence ratchets. The concern are manufacturers of the Diamond extension stove backs, suitable for use in all kinds of cooking stoves, and an adjustable stove pipe thimble, which protects wood work when stove

pipes pass through floors. They also make two lines of revolving chimney tops, for which they furnish the fittings and give diagrams for cutting the sheet iron work. Their line includes gasoline stove repair burners of different styles, gasoline torches, covers for gasoline stoves and cover plates, tinnerns' snips, socket wrenches, stove clamps, breast drills, stove carriers and trucks, coal hods, stove beards, stove pipe and elbows, fire shovels, poker, shakers and cover lifters, which are carried along with a variety of stove knobs, hinge pins, turn keys, stove bolts, stove putty and furnace cement, stove polish, stove urns, mallets and brushes. A variety of adjustable grates, covers, dampers, cross pieces and centers complete the book. The adjustable grates are so constructed that they can be fitted to many different sizes of stove and range fire boxes.

THE GAS, GASOLINE AND OIL STOVE TRADE.

The manufacturers of gas, gasoline and oil stoves have hardly gotten through with winding up the business of the summer season, yet they are now busily engaged in getting their lines in condition for the next campaign. There seems to be no exception to the general conclusion that the trade of the past season has been very good, and although it is early to correctly read the future the opinion is freely expressed that promises for a good trade are very bright. Equally strong is the idea that the market will be firm and that an advance in prices is a reasonable expectation. To justify such a step there is a general report, not only of substantial improvements in old goods, but of many new goods being brought out by different houses and of the extension of lines that are already popular.

GAS STOVES.

In this branch of trade there is evidence that there has been some reduction in prices beyond what is considered advisable, and the opinion is quite generally manifest, not only that there should be an advance in prices, but that there will be. One manufacturer points out that the trouble with the gas stove business is that there is absolutely no agreement among manufacturers, and that some manufacturers are weak in maintaining their prices. Because orders do not come in during the winter months they become afraid of being left with more stock on their hands than they desire to carry, and cut their prices in order to dispose of their output. This year has shown that many orders were booked at cut prices during the winter months by manufacturers who learned, as spring opened, that the orders which flooded them could readily have been obtained at a better margin of profit. They were forcibly reminded through the season that the very meager profits secured in consequence of their early scare were not only a disadvantage to themselves, but to their *confrères* in the business.

Labor of all kinds, it is pointed out, is scarce, and from the small boy to the expert mechanic wages have been materially advanced. With these facts before them it would seem that the gas stove manufacturers should be about ready to meet and discuss questions of so much importance to them, with a view to reaching an agreement in regard to the marketing of their product. Some gas range manufacturers hold to the opinion that the methods followed by the vapor stove manufacturers might be adopted in the gas stove trade with advantage, and that thereby a steady market might be maintained at a profitable selling price. This action, it is believed, would meet with no serious objection by those who do the work of distributing the goods. Some difficulty, however, might be met with in reaching this conclusion, inasmuch as the retail stove dealer does not effect the final disposition of this class of goods, for the gas companies throughout the country have been large purchasers of these stoves and their method of selling at practically cost price to the retail dealer has seriously crippled a very valuable medium for the introduction and sale of gas goods. The report is quite general of difficulty in securing planished iron and sheets for manufacturing these goods.

Improvements in the construction of burners and of

stoves is a marked feature of the outlook as well as a declaration of intentions to bring out new and desirable patterns of gas ranges and other lines of gas goods. "The prospects for new business have never been better," is the expression of one manufacturer, and this statement measurably reflects the opinion of many others. It is further stated that prices are fair, although hot competition has materially cut down profits. The gas stove trade of the present year is looked upon in a general way as fairly satisfactory, when taken in comparison with that of other years. There seems to be evidence that each year the gas stove business has a tendency to open earlier and extend over a longer period, all of which is very gratifying to the trade.

GASOLINE STOVES.

For many years the gasoline stove has been a large factor in the consumption of the gasoline produced, and it is pointed out by some that the advent of the gasoline motor and the scarcity of the supply may have some effect on the price of this fuel. This, however, is not looked upon as likely to have any serious influence on the sale of gasoline stoves. The high temperature attainable with gasoline burners and the fact that the operation of the stoves is now so widely understood as to give them an established popularity, together with the perfection obtained in the construction of the burners, valves and every part promises well for the coming season's business. Nevertheless, it is reported by some manufacturers that new and valuable improvements, suggested by the experience of last year, will be embodied in new constructions, and manufacturers are vying with each other to put on the market more attractive goods than ever before. Reports from various sources for the current season disclose a very satisfactory increase in the general demand for gasoline stoves and there is a growing feeling of confidence that the coming year will be a very profitable one. Although this sentiment is quite general, it is, however, too early as yet to give anything like a conclusive opinion on this head.

Evidently the cabinet style of stove continues in popularity, as new lines of these goods are to be put on the market. Complaints are quite general with reference to the impossibility of securing some material, more especially sheet steel and pipe, within a reasonable time, and it is possible that sales have been curtailed owing to this fact. It is probable, however, that this may have been a factor of strength in the market. Owing to the higher price of many materials and labor employed in the construction of these goods, the probability of an advance in prices is very strong. Some houses go so far as to say that their plans are fully formulated and that there will be a slight advance in the list prices of gasoline goods to compensate for the advance in the cost of production. Conservatism and competition, however, evidently will have an effect on the proposed advance, as it is understood that the advance will be by no means commensurate with the increase in the cost of the goods. In the opinion of one prominent manufacturer in this field the prospect for the coming year's business is far better than it has been for the past two years, and there will be more activity in the industry than there has been for some time.

OIL STOVES.

In connection with the oil stove trade the fact is brought out that oil producers are vigorously pushing the sale of all oil consuming goods, owing to the fact that the demand for gasoline bears an excessive proportion to the natural production of gasoline and coal oil. The manufacturers seem to be working in harmony with this effort, and new oil stoves are to be brought out by a number of different houses. During the past year the wickless blue flame oil stove of the newer construction, equipped with what is known as the student lamp tank, has demonstrated a high efficiency, and it is probable that this style will be favored in many of the new lines of cooking apparatus. This type of construction has also won favor in connection with oil heating stoves, and new patterns of this type of stove are also to be added to the constructions to be brought to the attention of the trade by the different manufacturers. Apparently, the oil stove trade is divided into two classes,

characterized by some manufacturers as cheap stoves and high grade goods. Evidence of competition in these goods is not wanting, and it is probable that while the past season is reported as having been a very good one, the profits were not as large as they would have been had competition been less sharp.

In this line of goods the prospect for the future is said to be excellent, and the trade is not confined to the United States. It is claimed that quite a considerable foreign demand for oil stoves has been created, with a promise of substantial increase, if it is given the consideration which it merits. Some difficulty has been experienced in securing material used in the construction of oil stoves, and the impression is quite general that prices will be slightly advanced, probably sufficiently so to cover the increased cost of labor and materials. Others, however, are of the opinion that the market will hold firm at the present level. The prevalence of these views is an indication that buyers may have to pay higher prices to secure their needed stock. These conclusions reflect a very satisfactory condition in this line of trade, particularly to the manufacturer, and it is doubtful if the dealers, when thoroughly conversant with them, will raise any material objection.

It is worthy of note that, so far as gasoline and oil stoves are concerned, the distribution is left to the regular stove dealer, and there is no competition, as in the gas stove trade, to market these goods practically at cost and thus interfere with the regular trade.

The Hustler Furnace.

In the accompanying illustrations we show the Hustler hot air furnace, made by the Patric Furnace Company, Springfield, Ohio, which is especially designed for burn-

The Hustler Furnace.—Fig. 1.—Broken View, Showing Construction.

ing soft coal. Fig. 1 presents a broken view, from which the construction and operation may be understood. The furnace consists of the usual ash pit section, on which rests a special form of fire pot, to the front of which is attached a soft coal feed and coking magazine, shown in Fig. 2. Above this is the combustion chamber and radiator, arranged to present a large heating surface for the air passing through the furnace, and constructed with a special hot blast chamber. A top view of this chamber is presented in Fig. 3, and a bottom view in Fig. 4. As will be seen from the broken view in Fig. 1, the pipe A extends up from the air heating chamber and through the furnace casing, arranged for an inflow of air to be heated before it is discharged through the perforations in the plate, shown in Fig. 4. By this means air of a high temperature is brought in contact with the products of combustion which rise from the soft coal.

These products of combustion, being heavily laden with free carbon, ignite on being mixed with the air and are consumed, avoiding the dense smoke that is produced in the ordinary form of soft coal furnace. It is pointed out that this not only effects an economy of fuel, but greatly increases the heating capacity of the furnace.

Another convenient feature is the soft coal feed and coking magazine. Extending through the front of the furnace from the fire pot is a chute with a drop door

Fig. 2.—Fire Pot and Coking Chamber.

having strong, heavy hinges. This is designed to be filled with soft coal. As the fire burns the gases are liberated from this fuel, which is coked by the process, while the gases produce heat by being consumed. This enables the fire to be kept much longer with soft coal than is the case with furnaces of the ordinary construction. In addition to the hot blast, by operating a thumb screw attached to the door of the coking chamber air can be admitted through it to aid the burning of the gas, and when the coke has been formed it can be pushed in on the grate to be burned, and the chamber charged with a fresh supply of fuel.

Another important feature of the furnace is the method of making gas tight connection between the

Fig. 3.—Top View.

Fig. 4.—Under Side.

Hot Blast Chamber.

castings and the steel plate forming the radiator. The radiator heads are made with double flanges, so that the steel shells fit between and when filled with asbestos cement this is said to make a permanent gas tight joint. The castings are made heavy so that they can be drawn tightly together by means of suitable rods. The furnaces are made in five different sizes, rated to heat from three to four rooms in the small size, to 10 to 14 rooms, or 90,000 cubic feet of space, in the large size.

FURTHER particulars concerning the new buildings to be erected by the Kalamazoo Stove Company of Kalamazoo, Mich., are to the effect that the walls will be entirely of concrete, the details having been worked out by the officials of the company. There will be a main structure 350 feet long by 120 feet deep, of which 200 feet will be two stories in height and 150 feet one-story in height, the latter being used for the molding room. There will be a separate power house, 42 x 62 feet, and all machinery will be operated by means of electric motors. The equipment will be modern in every respect, and the company expect to have everything in running order shortly after January 1. We understand that they will make a specialty of Sheet Steel Ranges and Cook Stoves, as well as Oak Stoves. The management of the company is vested in Edward Woodbury, president; William Thompson, vice-president and general manager; Charles E. Dewing, treasurer, and A. H. Dane, secretary.

ODD PLATES.

THE UTICA HEATER COMPANY of Utica, N. Y., are distributing the last speech of William McKinley, bound in a brown paper cover, with a portrait of the late President on the first page. The souvenir is not confined to those who use the Utica Superior Furnaces, but is also being sent to many in the heating trade.

STOVE DEALERS will be interested in the 18-page catalogue issued by W. H. Colebrook & Sons Company, Syracuse, N. Y. The first pages are devoted to the Crown Asbestos Cement for stoves, furnaces and ranges, followed by a variety of all styles of Cement suitable for linings of fire chambers of stoves, and for making tight joints between the different parts of a stove. The Black Flag Crown Paste and Stove Polish are made for using with either water or benzine, and convenient for household as well as for shop use. Stove Putty, Pump Valves, Hose Washers, Asphaltum Varnish, Roof Paint, Glue and Ebony Enamel are other articles enumerated in the catalogue.

E. F. KURTZ, 41-43 North Second street, Philadelphia, Pa., is sending to the trade a neat folder printed in dark blue, giving a list of the Stove Repairs from original patterns that are carried by him in stock, ready for prompt shipment. The second page of the folder gives an extensive variety of supplies for stove men, including everything from Stove Putty and Stove Polish to Pipe Collars, Fire Clay, Pokers, Shovels, Coal Hods and Oil Stove Wicks.

THE AMERICAN FURNACE COMPANY, St. Louis, Mo., makers of the American Steel Furnaces, are compelled to run their foundry and construction department night and day in order to supply the demand for their products. A card has recently been issued by this concern showing on one side a picture of Uncle Josh standing on a register enjoying a large volume of hot air, which has greatly disturbed the hang of his coat tails and whiskers, and has raised the hat from off his head. The card is headed "Have Your Chills Cured with the American Furnace." Other appropriate reading matter is printed on both sides. The purpose of the card is for distribution among dealers, space being left for their name.

THE COLE MFG. COMPANY, the original manufacturers of Cole's Air Tight Wood Heaters, Hot Blast Coal Heaters and Tank Heaters, are now building an additional fire proof warehouse at their works, which are located at 3218 to 3238 South Western avenue, Chicago. This warehouse will cover a ground space of 50 x 150 feet and will be three stories in height. The company are contemplating further enlargements of their facilities, which are overtaxed in endeavoring to meet the demands of their customers. They have an output of 600 Stoves per day, but this large product does not enable them to keep up with their orders. They are at present nearly 10,000 Stoves behind. The company are constantly at work on new ideas and intend to bring out a Range for the next season's trade which will have not only new features, but will embody radical changes in Range construction.

THE LENOX FURNACES, which are made in several sizes for hot air heating and for combination hot air and hot water heating, by the Lenox Machine Company, Marshalltown, Iowa, are described in a little folder, so as to bring out all of their points of practical utility. The Lenox Furnace is also made the subject of a 20-page pamphlet containing testimonials from persons who have used these heaters with satisfactory results. The list includes not only residences, but churches and a variety of public buildings.

THE A. & J. STOVE COMPANY, Gadsden, Ala., have just completed their foundry and expect to have it in operation in a very short time. We understand that the company will turn out eight sizes of Stoves intended for using wood as a fuel, eight sizes of Coal Heaters, three sizes of Club Grates, and three sizes of regular frame Grates, as well as all kinds of Hollow Ware.

"It's about time for you to fork over that Cement order," is the headline on a card that is being sent through the mails by W. H. Colebrook Sons & Co., Syracuse, N. Y. Attached to the card and giving point to the

remark above quoted is a small tin fork. The company claim to be the largest manufacturers of Asbestos Furnace Cement in the world. The Chas. Smith Company, 122 Lake street, Chicago, are their Western selling agents.

ORR, PAINTER & Co., the Sunshine Stove Shop, Reading, Pa., report a very large trade in Heaters and Steam and Hot Water goods. Oak Stoves are also coming in for a large share of trade and the general line of sales is said to be well above the average at this time last year. Trade conditions are decidedly better this year, and all departments of the plant are running on full time.

EDWARD J. ETTING, with offices in the Land Title Building, Philadelphia, and 39 Cortlandt street, New York, announces that he has been appointed agent for the S. Obermayer Company, and is prepared to furnish a complete line of supplies, Plumbago Facings, &c., required in foundries and shops. This arrangement, in connection with the cranes and equipment manufactured by the Whiting Foundry Equipment Company, will enable Mr. Etting to equip iron, steel and brass foundries complete.

THE MONCRIEF-CARTER FURNACE COMPANY, Atlanta, Ga., have recently enlarged their foundry, increasing its capacity 50 per cent. The increasing demand for their Furnaces has made this extension necessary. They have just completed a large heating plant for the opera house at Greenville, Texas, and are now putting a heating plant in the school building of the same town. The company have a contract for heating one or more large school buildings at Berkley, Va., and several contracts for churches and school buildings at Winston and other cities in North Carolina and in the State of Mississippi. The rule of the company is to personally supervise the installation of their Furnaces, as they consider this the most important element in securing the success of a heating plant.

The P. & S. S. League.

On Monday night, after the bowlers in the Plumbing and Steam Supply League, at the Monarch Alleys, Twenty-sixth street and Sixth avenue, New York, could see through the smoke of the battle, the team of Thomas G. Knight were seen as the winners of two victories, while the John A. Murray team suffered two defeats, and the Fred. Adece & Co. team split even.

On Thursday night the individual records were again transferred. The team of Ronalds & Johnson Company, New York, were twice losers, while the teams of the Crane Company and Central Foundry each tasted victory and bitter defeat. A. E. Good of the Crane Company team scored 192, and repeated in 210, which gives him the honor of individual high score, surpassing the 198 of M. Behrer. He was closely followed by J. S. Dibley of the Central Foundry Company team, who scored 173 and repeated in 199. These high scores were made in the last contest of the evening, when Good and Dibley were contestants, as anchors of their respective teams.

THE GRAY HARDWARE & IMPLEMENT COMPANY, St. John, Kan., have been organized with a capital stock of \$10,000. They are successors to Gray & Co., dealers in Hardware, Stoves, Tinware, Agricultural Implements, Sporting Goods and Harness.

Bids will be opened on November 5 at the Navy Department in Washington for supplies for the Mare Island Navy Yard, at San Francisco, Cal. Among the materials required are the following: Two hundred pounds of copper rivets and burrs, 600 pounds of copper tacks, 75 pounds of copper washers, 50 dozen steel wire foundry casting brushes, 1000 pounds of brass rods, 305 sheets of braziers' copper, 19,500 pounds of flat bar iron, 13,000 feet of steam pipe, 2800 feet of seamless brass pipe, a variety of plumbers' supplies, unions, bushings, elbows, nipples, tees, 109 dozen brass globe valves, 700 sheets of galvanized steel and 16,000 pounds of sheet lead.

An Electric Air Heater.

Wherever incandescent electric lights are used for lighting offices or residences the Electric Air Heater, shown in the accompanying engraving, can be used. These heaters are made by the American Electrical Heater Company, 195 River street, Detroit, Mich., in a number of sizes from 12 to 20 inches in length, from 12 to 17 inches in height, and in two widths, 3 and 4½ inches. They are equipped to work under a voltage of 50 to 500 and to furnish from 750 to 6000 watts. Their heating capacity may be rated on the basis of from 2 to 3 watts for each cubic foot of space to be heated in well constructed buildings. The company inform us that these heaters are coming into very general use and that their sales thus far this season have been more than double their entire output for last year. The convenience of these heaters is readily seen when it is pointed out that they are light in weight and can be easily transferred from one apartment to another, it only being necessary to connect the incandescent light-

An Electric Air Heater.

ing wires with the heater, when heat is generated as soon as the connection is complete. It is also pointed out that as no combustion has taken place they give out no odors and do not vitiate the atmosphere. This little room heater is one of many domestic and industrial heating appliances made by this company, including soldering coppers, sad irons, cooking stoves, curling iron heaters, foot warmers, glue pots, solder pots and sealing wax heaters.

Bathroom Fixtures and Specialties.

Searls Mfg. Company, Newark, N. J., whose New York office is with Frederick Klages, Eastern and export manager, 127 Duane street, have added a number of new articles to their large assortment of bathroom and household specialties. Among them is a line of brass, bronze and nickel plated hat and coat hooks, with single, double, triple and quadruple hooks of solid metal. In this category also is a combination hat and coat hook for hall use, the extreme dimensions of which are 13½ x 26 inches, the latter being the width. The arms are all curved, the main or lower arms being of tubing ⅝ inch in diameter, while the lesser arms are solid and ¾ inch in diameter, there being a total of six arms for clothing, hats, &c. Another line consists of two holders for soda water bottles, both of which have four gracefully formed wires to clasp a bottle, with variation as to base. In addition to the goods mentioned there is a very complete assortment of combination fixtures for bathrooms in the way of holders for various articles, such as a tumbler, tooth brushes and soap, a portion of which are fitted with mug, brush holder and soap dish, all of china, while others are intended for combinations of china and glass, there being a total of 20 variations in the combinations. One of the later additions is a towel rack with glass bar, made both single and double, one of which with single glass bar has 2¼-inch glass balls at each end of the bar and is very artistically gotten up. In match safes there are two attractive styles for table use of heavy cast bronze metal, one of which is designed to hold a box of safety matches, the other having an orna-

mental receptacle for parlor matches; both have ash trays and are handsomely polished. These match safes are particularly suitable for libraries, hotels, cafés, clubs, &c.

The Boss Rotary Washing Machine.

The Boss Washing Machine Company, Cincinnati, Ohio, are offering the washing machine here shown. The

Fig. 1.—The Boss Rotary Washing Machine.

gearing is composed of four castings, all of which are intermeshed to insure immediate and concurrent action of all parts when one part moves. There is no lost motion, which, it is stated, is an important feature, as lost

Fig. 2.—The Boss Rotary Washing Machine Open.

motion is referred to as the principal cause of breakage in rotary washers. The cogs and all of the castings are extra heavy, it is explained; also that the weight of the castings and the simplicity of the mechanism overcome danger of breakage of any parts. In designing the machine it was the aim of the manufacturers to secure more than a full revolution to the pinwheel before reversing each time.

J. W. PUGH is successor to Rorem Bros., Jewell, Iowa, dealers in Shelf and Heavy Hardware, Stoves and Tinware. Mr. Pugh has enlarged the stock thus acquired.

Aluminum Tea Kettle, Pudding Pan, Etc.

Wagner Mfg. Company, Sidney, Ohio, for whom Neal & Brinker, 18 Warren street, New York, are the Eastern and export representatives, have recently put on the

Fig. 1.—Cast Aluminum Kettle with Self Raising Lid.

market several additions to their already extensive assortment of aluminum hollow ware and kitchen utensils, as here shown. Fig. 1 is a tea kettle, the lower part of which is a one-piece casting of pure aluminum; Fig. 2, representing the same utensil, but showing to better advantage the method of automatically raising the lid. On one side of the lid, which is also cast in one piece, is

Fig. 2.—The Lid Automatically Raised.

an arm, projecting at such an angle that by a downward pressure of the wood handled bale it raises the lid for refilling the kettle at faucet or on the stove without danger of burning or scalding the hand. As aluminum absorbs heat rapidly these kettles are only made in flat bottom styles, in sizes 6, 7, 8 and 9. Fig. 3 represents a polished aluminum soap dish. Fig. 4 is an illustration of a pudding pan cast in one piece of aluminum.

Fig. 3.—Polished Aluminum Soap Dish.

Fig. 4.—Cast Aluminum Lipped Pudding Pan.

This pan is made in both 4 and 7 pints capacity, and being much thicker than similar pans of stamped ware will not warp. Attention is drawn to the side lips as a convenience for lifting the pan.

F. C. HOFFMAN has recently embarked in the Shelf Hardware, Stove, Tinware, Farm Implement and Sporting Goods business in Mt. Zion, Ind.

Stove and Hardware Dealers.

THE Southern Hardware Jobbers' Association are inviting prize essays on trade mismanagement and its attendant consequences as viewed from the traveling man's standpoint, the competition opening October 1 and closing February 1, 1902. The prizes offered are \$50, \$25 and \$10. Any traveling salesman connected with any Southern jobbing house is eligible to enter this competition. The essays will be printed and numbered and sent out to the membership of the association, with the request that they vote on the same, the essay receiving the largest number of votes being adjudged the best, the author of which will be invited to attend the next meeting of the association and read his paper.

H. L. BLOOD & Co. have opened a store at 59 Central street, Leominster, Mass., with a full line of Stoves, Ranges and Hardware.

THE ALABAMA MFG. COMPANY, who are erecting an Iron Hollow Ware plant at North Birmingham, Ala., will manufacture all kinds of Kitchen Utensils, such as Pots, Pans, Griddles, Pokers, &c. The following comprise the company: Samuel E. Jones, Bolling Jones and John R. Diekey of Atlanta, Ga.

THE MARIETTA CASTING COMPANY, Marietta, Pa., are distributing a folder giving illustrations and prices of a variety of their Hollow Ware, including Maslin Kettles, Oval and Round Boilers, Deep Stew Pans, Saucepans, Scotch Bowls, Evaporating Dishes, Glue Pots, Yankee Bowls and Mortars and Pestles.

THE BROWN-HURLEY HARDWARE COMPANY have recently purchased the old established business of J. D. Seeberger, Des Moines, Iowa, and will add to their Shelf Hardware line a jobbing line of Stoves, Paints and Sporting Goods. They would like late catalogues and price-lists from all manufacturers of general Hardware and lines as specified above.

THE plant of the Moseley & Stoddard Mfg. Company, Rutland, Vt., manufacturers of Dairy and Creamery Goods, was destroyed by fire on the 5th inst. The company advise us that they will rebuild at once, and hope to have their new quarters completed by the first of the year.

FOREST CITY PAINT & VARNISH COMPANY, Cleveland, Ohio, are sending out with their compliments an attractive aluminum cigar ash receiver, which will doubtless be appreciated by their customers.

LOVELL MFG. COMPANY, Erie, Pa., issue a catalogue showing their extensive line of Wringers, as well as Mangles, Rat and Mouse Traps, &c. A separate pamphlet is issued which illustrates a line of Wringers made especially to meet the demand for low priced machines.

THE GAS TIP & SELF LIGHTER COMPANY, 298 Broadway, New York, are distributing circulars describing their Aluminum Gas Tips, Self Lighting Tips and Burners, &c.

W. H. H. THATCHER has moved his stock of Hardware, Agricultural Implements, Stoves, &c., from Wichita Falls, Texas, to Lawton, O. T.

G. A. BIGGS has lately engaged in business in Hobart, O. T., handling Shelf and Heavy Hardware, Stoves, Tinware, Farm Implements, Sporting Goods, &c.

M. H. COON, Clark's Green, Pa., has broken ground for an annex to his Hardware store. The annex will be 18 x 36 feet, two stories high. Mr. Coon's stock covers General Hardware, Stoves, Tinware, Agricultural Implements, &c.

BAKER & McCABE have succeeded Baker, Roth & Watson in the Hardware, Stove, Harness, Farm Implement and Sporting Goods business in Paekwood, Iowa.

ST. PAUL HARDWARE COMPANY, St. Paul, Minn., wholesale and retail dealers in Hardware, Cutlery, House Furnishings, &c., have disposed of their business to J. F. McGuire & Co.

L. K. JONES HARDWARE COMPANY have opened a new store in Hobart, O. T., handling a line embracing Hardware, Stoves, Tinware, Sporting Goods and Agricultural Implements.

STRAINED RELATIONS IN THE PLUMBING TRADE.

The provisions of the New York Conference Resolutions for arbitration and joint action in cases of disputes and infractions have been abrogated by the Executive Committee of the National Association of Master Plumbers, as is indicated, with the cause, in the following letter from President E. D. Hornbrook to Charles W. Woodward, secretary of the National Committee of the Confederated Supply Associations:

PRESIDENT'S OFFICE, KANSAS CITY, MO., }
September 20, 1901. }

Chas. W. Woodward, Secretary, National Committee of the Confederated Supply Associations, New York, N. Y.:

Dear Sir: After making several requests of you to carry out the provisions of the Revised New York Conference Resolutions, and to act on cases of violations of the said resolutions where your members had admitted the violations, I felt obliged to write you on August 31 that we must have a definite answer by September 10 as to what you proposed to do with the several cases referred to you prior to our national convention in June.

Last February complaints for violations of the New York Conference Resolutions by James B. Clow & Sons of Chicago were referred to you, and after considerable correspondence and urging on our part these complaints and later ones were submitted to the Joint Standing Committee on Conciliation. The said committee found Clow guilty, and their decision was sent to you on July 25. Having waited some time to hear from you on this case, I inquired what had been done, or what would be done, and you advised me on August 20 that Clow had positively refused to be governed by the findings of the Conciliation Committee. We, of course, expected that the joint resolutions would be carried out promptly, as you had previously advised me that Mr. Torrance and yourself had agreed on what action was necessary. On September 2 I asked you for a definite answer by September 10 as to whether you proposed to enforce the joint resolutions in the Clow case.

Your letter of September 9, in answer to my several letters, gives us no information as to what you propose to do, or any assurances as to when you will take action. It is simply delaying matters, which is very unsatisfactory to the members of our association, as well as to the loyal jobbers and manufacturers.

We have given the New York Conference Resolutions a trial of more than a year, and in every instance our Executive Committee have acted promptly and carried out our part of the agreement. We very much regret that the National Committee of the Confederated Supply Associations have not done so.

In view of this state of affairs, our Executive Committee have decided to abrogate the agreement heretofore existing, known as the Revised New York Conference Resolutions. I hereby officially notify you that on and after this date the National Association of Master Plumbers will no longer be bound by said agreement.

Yours very truly,

E. D. HORN BROOK, President.

The views of the National Committee of the Confederated Supply Associations on this action are presented in the following reply to the above letter:

SECRETARY'S OFFICE, NEW YORK, N. Y., }
October 3, 1901. }

E. D. Hornbrook, President, National Association of Master Plumbers, 1212 Main St., Kansas City, Mo.:

Dear Sir: At the meeting of the National Committee of the Confederated Supply Associations held at New York City on October 2, 1901, the following resolution was unanimously passed:

"That we do not admit the right of the National Association of Master Plumbers to abrogate the New York Conference Resolutions as per your official letter of September 20.

"That at their adoption the matter of conference upon all subjects pertaining thereto was an implied principle to be followed by both parties to the agreement.

"That we, as the National Executive Committee of the Confederated Supply Associations, reaffirm our adherence to the New York Conference Resolutions."

In addition to the above resolutions a Committee of Four was appointed to undertake to carry out the findings in the adjudicated cases which have come before the Joint Standing Committee on Conciliation.

Yours very respectfully,

C. W. WOODWARD, Secretary.

On receipt of the above letter the action taken in the original communication was confirmed at a meeting of

the Executive Committee of the National Association of Master Plumbers, and the following letter was sent to Secretary Woodward, notifying him of the same:

PRESIDENT'S OFFICE, KANSAS CITY, MO., }
October 14, 1901. }

Chas. W. Woodward, Secretary, National Committee of the Confederated Supply Associations, New York, N. Y.:

Dear Sir: I am in receipt of your letter of October 3, in which you quote a resolution adopted by the National Committee of the Confederated Supply Associations at their meeting in New York City on the 2d inst. Your letter was received just prior to my departure for Cleveland to attend a meeting of our Executive Committee, called for the purpose of considering plans for our future guidance.

At our meeting in Cleveland your letter of the 3d, as well as other letters, was read, and the Executive Committee unanimously reaffirmed their vote, taken by mail, repealing the New York Conference Resolutions. There was nothing else to be done, as you had failed to act on several admitted violations of the joint resolutions on the part of your members, as well as the case particularly mentioned in my letter of September 20.

In your letter of the 3d you state that you do not admit our right to abrogate the New York Conference Resolutions. There is nothing in the said resolutions as to how they shall be repealed. It was expected that they would be continued as long as they were mutually satisfactory, or until one party acted in bad faith. In view of the fact that your side have broken their part of the agreement, in failing to carry out the findings of the Joint Standing Committee on Conciliation, and declining to carry out the resolutions in three instances where your members persisted in violating the resolutions, I fail to see how one party to an agreement can be held and the other party allowed to violate or decline to observe the same.

At the meeting of the Executive Committee held in Cleveland on the 7th and 8th of this month new resolutions were adopted, which will be known as the Cleveland Resolutions. They embody the New York Conference Resolutions excepting the provisions for arbitration and joint action in cases of disputes and infractions. By conservative yet prompt and businesslike measures we expect to secure proper trade protection, which we regret we could not get under the New York Conference Resolutions owing to their not being enforced by your side.

Your very truly,

E. D. HORN BROOK, President.

The trade was then informed of the action taken by the following letter:

PRESIDENT'S OFFICE, KANSAS CITY, MO., }
October 17, 1901. }

To the Manufacturers and Jobbers of Plumbing Material:

Gentlemen: I herewith submit for your information a copy of my letter of September 20, 1901, addressed to the secretary of the National Committee of the Confederated Supply Associations, in which I gave notice of our refusal to be governed by the New York Conference Resolutions, for the reasons stated in my letters to Mr. Woodward. I also inclose you a copy of a letter received from Mr. Woodward on the subject, and my reply thereto; all of which are self explanatory.

I believe that all loyal manufacturers and jobbers will regret, as we do, the repeal of the joint resolutions, and will agree that it was the proper and only step we could take under the circumstances.

The Executive Committee of the National Association of Master Plumbers met in Cleveland, Ohio, on October 7 and 8, 1901, and adopted new resolutions for the protection of the plumbing trade. I inclose you a copy of the said resolutions. After a careful perusal you will observe that they are practically the New York Conference Resolutions, except there are no provisions for arbitration and joint action in cases of disputes and infractions.

We propose to be very conservative and just in all our acts, as the resolutions indicate, and in every case the rights of the manufacturers and jobbers, as well as the plumbers, will be protected.

As soon as possible a list of recognized master plumbers in localities where we have members will be published and furnished gratuitously to manufacturers and jobbers.

Yours very truly,

E. D. HORN BROOK, President.

The resolutions mentioned in the above letter are given below:

CLEVELAND RESOLUTIONS.

Unanimously adopted by the Executive Committee of the National Association of Master Plumbers at a meeting held in Cleveland, Ohio, on October 8, 1901:

Whereas, The members of the National Association of Master Plumbers of the United States desire more adequate trade protection from the manufacturers of and dealers in plumbing goods, and for the purposes have adopted the following resolutions:

1. The members of the National Association of Master Plumbers are requested to confine their purchases of plumbing goods to manufacturers and jobbers who are willing to assist in improving the condition of the plumbing business, and who sell plumbing goods in localities where there are members of the National Association of Master Plumbers only to recognized master plumbers whose names appear in the national directory of master plumbers, published under the supervision of the National Association of Master Plumbers.

No plumbing goods shall be furnished to consumers under any conditions.

All lists must be submitted to the officers of the various State associations and approved by them before being sent to the National Association.

When affiliated associations forward lists of recognized master plumbers to be published in the national directory, or when affiliated associations shall remove any names from either list, or request their removal, all the facts must be submitted to the president of the National Association, who may use his discretion as to whether the circumstances or facts warrant the publication of such lists or the removal of any names.

2. It shall be the duty of the secretary of each State or local association affiliated with the National Association to furnish a list of recognized master plumbers in his locality to the president of the National Association of Master Plumbers within 30 days after the publication of these resolutions, and thereafter advise the said president on the twenty-fifth day of each subsequent month of any changes in the said list.

Failure to furnish such lists of recognized master plumbers, and to make corrections promptly, will subject the association guilty of such negligence to the loss of benefits of membership in the National Association during the time of such dereliction of duty.

3. Manufacturers or jobbers who sell or exchange plumbing goods with other manufacturers or jobbers who furnish plumbing goods to those not on said list of recognized master plumbers shall not be considered in accord with these resolutions.

4. Copies of the lists of recognized master plumbers shall be furnished gratuitously to manufacturers and jobbers in accord with these resolutions, and each month, or more frequently if necessary, supplements to the general list shall be issued and likewise distributed.

5. The names of manufacturers and jobbers who are considered in accord with these resolutions shall be printed in pamphlet form, under the supervision of the National Association of Master Plumbers, and distributed to those who are members of the National Association of Master Plumbers, with the request that they bestow their patronage upon those whose names are upon the said list of manufacturers and jobbers.

Supplements to this list shall be issued monthly, or more frequently if necessary.

6. In order to aid in honest dealing and the payment of just debts, manufacturers and jobbers are requested not to furnish plumbing goods to any one for a building, or addition to a building, where a manufacturer or jobber in accord, or a member of the National Association of Master Plumbers, has not been paid in full what is justly due him for goods furnished for such building or for work performed upon such building.

Manufacturers or jobbers furnishing plumbing goods contrary to this section shall not be considered in accord with these resolutions.

7. Master plumbers shall not finish work or furnish plumbing goods for any building, or addition to any building, where a manufacturer or jobber in accord, or a member of the National Association of Master Plumbers, has not been paid in full what is justly due him for goods furnished for such building, or his work performed upon such building.

Master plumbers finishing work or furnishing goods for such buildings contrary to this section shall not be recognized as master plumbers.

8. To assist in carrying out the intent of sections 6 and 7, manufacturers, jobbers or master plumbers shall furnish the president of the National Association of Master Plumbers with complete information, evidence and sworn statements, showing that the building is in default to any manufacturer, jobber or master plumber.

The manufacturer, jobber or master plumber wishing to avail himself of the protection under sections 6 and 7 may also furnish proper information to those in his section who may be directly interested.

Failure to promptly furnish said notice shall forfeit the right to claim and receive protection under sections 6 and 7 of these resolutions.

When a building is thus in default and a notice has

been duly issued it is to be presumed that an early settlement will be reached, and in order that a wrong shall not be done any one, it shall be the duty of the one filing the notice to notify the president of the National Association of Master Plumbers every week after the filing of the notice that a settlement has, or has not, been reached. Failure to send this notice shall forfeit protection under sections 6 and 7 of these resolutions.

It shall be the duty of the president of the National Association of Master Plumbers to furnish manufacturers and jobbers in accord, and the secretaries of master plumbers' associations, with a memoranda of all buildings in their locality in default, as prescribed in sections 6 and 7, immediately upon receipt of proper evidence of the accuracy of the facts reported. Immediately upon the receipt of a notice of adjustment of any claim notice shall be sent to the same parties.

9. Master plumbers found guilty of violating health laws or ordinances regulating plumbing or plumbers shall not be recognized as master plumbers.

10. It is a recognized rule in all lines of business that manufacturers and jobbers confine themselves to manufacturing and wholesaling.

Manufacturers or jobbers who conduct a plumbing business directly or indirectly, or who establish and maintain others in the plumbing business, shall not be considered in accord with these resolutions.

11. Master plumbers selling plumbing goods that they do not install, or who install plumbing goods that they do not furnish, in localities where there are members of the National Association of Master Plumbers, shall not be recognized as master plumbers.

12. Manufacturers, jobbers or their representatives in plumbing goods who give net prices or any discounts from list prices to those who are not recognized as master plumbers by the National Association shall not be considered in accord with these resolutions.

13. Manufacturers or jobbers sending net prices to master plumbers without requests for same shall not be considered in accord with these resolutions.

14. Manufacturers, jobbers or their representatives who directly or indirectly estimate on any job or jobs, or who take off lists of fixtures from architects' plans, and disseminate such information among the plumbing fraternity, shall not be considered in accord with these resolutions.

15. Manufacturers or jobbers accepting a waiver from a master plumber, allowing them to sell plumbing goods direct to others than recognized master plumbers, shall not be considered in accord with these resolutions.

16. Master plumbers giving, or offering to give, waivers to manufacturers or jobbers, to sell to others than recognized plumbers, shall not be recognized as master plumbers.

17. Manufacturers or jobbers furnishing goods on owner's, agent's or contractor's guarantees will not be considered in accord with these resolutions.

18. *Plumbing Goods.*—Plumbing goods include all fixtures used in connection with plumbing work and connected with the water or sewer systems, including iron and brass pipe and fittings used in connection with plumbing work. Compression, Fuller and self closing work and other miscellaneous brass work, when used in connection with plumbing work, whether for iron, brass or lead pipe, is considered plumbing goods.

Exemptions.—Ground key work is exempt when used by water works companies and as wind mill supplies; also compression bibs when used as wind mill supplies. Pipe, fittings and boilers, when used for purposes outside of plumbing, are not classed as plumbing goods.

Water meters and filters are not generally considered plumbing goods, but affiliated associations may make local arrangements regarding water meters and filters in their sections.

Those who furnish plumbing goods to be used for purposes foreign to plumbing work do so at their own risk—that is, they must know that they are not to be used for plumbing work.

19. *Exemptions.*—Under the conditions hereinafter prescribed the sale of plumbing goods to the following will not be considered contrary to these resolutions:

The Federal Government for Federal buildings, if purchased by Federal officers for Federal work, it being their intention to employ journeymen to do the labor.

State or county authorities, only for repairs where such authorities continually employ a journeyman plumber.

Public school buildings are not considered State or county institutions.

Railroad companies, only for use in their cars, or for fitting up pumping stations or water tanks along their lines for the supply of water to locomotives, and for repairs (not alterations or new buildings) in their buildings where they continually employ a journeyman plumber.

Gas and water companies for pipe and fittings, only for work on their lines outside of the building or curb, as may be the custom of the companies to run them, and for repairs (not alterations or new buildings) in their own buildings where they continually employ a journeyman plumber.

Car and ship building companies, only for use in their cars or ships, but not for work in their buildings.

Under the foregoing exemptions plumbing goods shall not be furnished for the private use of officers or employees of the Federal Government, State or county authorities, railroad, gas, water, car or ship companies; nor to contractors who may have contracts or sub-contracts with the Federal Government, State or county authorities, railroad, gas, water, car or ship companies.

New York City Notes.

Manhattan Branch is making active preparations for its annual entertainment and reception, which will be given at the Lexington Avenue Opera House on December 18. The Committee of Arrangements consists of Milton Schnaier, B. F. Donohoe, T. J. McCormack, John Boyd, T. J. Cummins and E. J. Brady. It is intended to make it one of the most enjoyable entertainments ever given by the association.

* * *

Trade still continues good and every one busy. The trouble with the journeymen plumbers has quieted for the present and the demand for good men is still unabated. No new jobs of importance have been given out during the past week, but hurry orders on jobbing and overhauling still continue to come in.

* * *

Business with the Examining Board of Plumbers is not as lively as usual, probably owing to the fact that all the journeymen are working and are not just now aspiring to become masters.

* * *

With all the work now being done there is a general complaint of inability to get money when it is due. This complaint is universal among those plumbers doing jobbing and overhauling.

* * *

James Armstrong of 52 Dey street is about winding up his large contract on the Immigrant Station at Ellis Island.

Affiliated Range Boiler Manufacturers.

It looks as if the usefulness of the confederation of the various manufacturers' and jobbers' associations was about to be put to a test. Last week we mentioned the appeal made by the Brass Manufacturers' Association to the jobbing trade, asking for recognition and preference for its members when the jobbing houses are placing orders for this line of goods. This week the manufacturers of galvanized kitchen range boilers issued a circular letter bespeaking for the members of their association the support of the jobbing trade. They say that the manufacturers whose names are given below are those who are affiliated with the National Committee of the Confederated Supply Association, and who, therefore, do not sell their goods to any except manufacturers and dealers recognized by the National Committee:

L. O. Koven & Brother, Ronalds & Johnson Company, Wm. B. Scaife & Brother, John Trageser Steam Copper Works, and Iron Clad Mfg. Company, New York City.

L. Wolff Mfg. Company, Chicago.

Henry McShane Mfg. Company, Baltimore, Md.

Detroit Range Boiler Company, Detroit, Mich.

Riverside Boiler Works, Boston, Mass.

New Sanitary Ware Plant

The Universal Sanitary Mfg. Company are a new concern who have recently started in the business of manufacturing sanitary earthen ware and plumbers' specialties with a capital stock of \$100,000 at New Castle, Pa. The company have just advised the trade that their pottery is now in operation and that they will make a complete line of plain and embossed staple goods. They also say they are in a position to make any specialties the trade might require. The company claim to produce a

ware that is equal to any on the market and they fully guarantee everything they make. While it is a fact that this is a new concern, all of those in charge of the pottery are people of experience in the sanitary earthen ware business. No expense has been spared in the erecting of the plant, the object being to be in position to make goods of the very best quality.

Artistic Bathroom Fittings.

Silver & Co., Brooklyn, N. Y., have just issued an 88-page catalogue devoted to artistic bath room fittings. These goods are made of brass, finely nickel plated, the design and finish being a special feature. Several pages are devoted to different styles of flat toilet paper holders and roll paper holders. Another line of goods is nickel plated towel racks, some consisting of a nickel plated rod supported by brackets, while others have a series of hinged bars, capable of supporting a greater number of towels, and some are furnished with a glass shelf for holding brushes and equipped with tumbler holder and soap cups. Thermometers for bathroom use are succeeded by an extensive variety of soap holders made to hang on the wall, attached to brackets for fastening to the wall, with pillars for attachment to the marble slabs of lavatories, or with hooks for hanging over bathtub rims. An equally extensive variety of sponge racks is made to conform to the style of the soap cups, and some are offered in combination for holding both soap and sponges. Similar racks are made for holding combs and brushes. A number of pages are devoted to an extensive variety of tumbler holders and tooth brush racks, with powder holders, and china soap cups, tooth brush vases, drinking cups and shaving mugs. Safety match holders are another line of specialties made in great variety. Coat, hat and wardrobe hooks for bathroom use, with whisk holders and bathroom mirrors and baskets for soiled linen and towels occupy another section. The Brooklyn shower bath rings, for use in connection with bathtubs, and seats adjustable to any size of bathtub, are followed by Turko-Russian bath cabinets and the heaters for use in them. The last pages show automatic gas lighting burners, metal polish and display boards for showing the firm's specialties.

The Lead Water Pipes of St. Paul's Cathedral.

Some interesting work was recently carried out at St. Paul's Cathedral, in London, in taking down one of the huge leaden water pipes, repairing it, and replacing it in its former position. In connection with this subject the *Ironmonger* calls attention to the fact that there are no rain water pipes visible either outside or inside the cathedral, whereas at most other ecclesiastical edifices—Westminster Abbey, for instance—the down pipes are rather a prominent feature of the external structure. The reason of this is that when Wren designed his masterpiece, having a considerable area to cover, he availed himself wherever he could of hollow construction, partly to save the cost of solid masonry and partly to reduce the weight of the massive building. Consequently, instead of disfiguring the outside of his building with numbers of rain water pipes, he left in the outer walls shafts, usually 3 feet by 2 feet in sectional area, inside which the pipes in question are safely and secretly housed. These shafts are fitted throughout with step irons, so that the workmen can readily pass up and down and keep the pipes under constant inspection without once entering the interior of the cathedral. The pipes, as already mentioned, are of lead, and being 8 inches square with the sides 3-16 inch thick, the work of taking down and replacing an entire length from top to bottom is no trivial task. Not the least remarkable point about the matter is that the pipes are those originally fixed up by Wren, and it speaks well for the quality of the metal selected by him that they should have remained serviceable so long. The authorities have not been able to identify the source from which the lead was obtained, but it is undoubtedly English, and though very hard in appearance, it casts and rolls to perfection. Many tons of this lead pipe are used in and about the cathedral.

A Plumbers' Specialty Catalogue.

Catalogue A, issued by the Diamond Stamped Ware Company, Detroit, Mich., is devoted to brass and nickel plated specialties used in the equipment of modern plumbing fixtures. The first pages show flush and supply pipes for high and low closet tanks, with and without compression stops, followed by pipe straps and adjustable pipe holders suited to these pipes. Another section of the catalogue is occupied by lavatory supply pipes with air chambers and with compression stops, supply pipes for bathtubs, lavatory traps, both with and without vents, of various styles, and plugs and washers for connecting both overflow pipes and lavatory waste and overflow pipes. Escutcheons for making a finish around nickel plated pipes, water closet seat hinges in a variety of styles and flush tank brackets form another section of the catalogue. Float balls for use in connection with ball cocks are shown in both smooth and corrugated form, and also in special shapes suited for special work. A variety of lavatory legs are presented, followed by trap covers, chain pulls and handles, patent overflow basin plugs, slip joints, chain stays, sink and overflow strainers, waste tubes, cock spouts, towel racks, soap cups, couplings, nuts and union basin wastes. A variety of nickel plated parts, washers, S hooks, friction rings, bumper plates and closet screw flanges take up a page, while another page shows a variety of soldering coppers, for both tinnern's and plumbers' use, including both swivel and seaming hatchets. The catalogue closes with a reference to the spun brass goods which the company are prepared to make to order.

Heating and Plumbing Notes.

THE CRANE COMPANY of Chicago, whose New York offices are at 490 Cherry street, recently secured a contract calling for the shipment of \$20,000 worth of Pipe, &c., for use in Russian Government mines in Siberia. The Pipe varies from 4 to 24 inches in diameter. The Crane Company are also turning out a \$10,000 lot of Piping, Valves, Fittings, &c., which will be installed in an electric plant at Lima, Peru.

THE MAKIN-KELSEY COMPANY, Philadelphia, Pa., have taken out city permits for the installation of hot water heating apparatus in the Club House at Tacomy, at a cost of about \$700. They will also install a similar plant at 604 Arch street, Philadelphia.

LEWIS CAMPBELL is building a new plumbing shop at Boyertown, Pa.

THE GLAUBER BRASS MFG. COMPANY, Cleveland, Ohio, report that business is very prosperous, and that they have been working overtime for 60 days with no immediate prospect of reducing the number of hours.

J. W. HUGHES, who is well known to the plumbers in the United States, with Sanitary Inspector Dore and Building Inspector Clausse form the Board of Examining Plumbers of Montreal, Canada.

GROUND was broken last week for the new factory building of the Louis Lipp Company, at Cincinnati, Ohio. The new plant will be located at Mitchell avenue and the Baltimore & Ohio tracks, and will be used for the manufacture of Plumbers' Supplies. The plant consists of two wings, each of which is 60 x 520 feet. In these two wings are nine different buildings, including foundry, enameling room, tin shops, machine shop, engine and boiler rooms, shipping department and offices. The buildings will be two stories high, and built of iron and brick at a cost of about \$75,000. It will be some months before the works will be ready for occupancy, but when they are completed the company will remove to them from their present quarters on Gest street.

THE Board of Fire Commissioners of Springfield, Mass., have awarded the contract for the heating plant of the Brightwood fire engine house to Whitecomb, Kirkham & Gray of Springfield.

THE municipal authorities of Madrid, Spain, have offered a prize of \$450 for the best model of a grating for draining openings in the street pavements, and another

of the same amount for a filter for water pipes, which must have a capacity to filter 211 gallons of water per hour. Models and descriptions must be submitted before the end of November. As the competition is not restricted to natives of Spain, American manufacturers may find it profitable to submit models and bids for supplying these requirements.

R. E. FOGWELL, Fall River, Mass., has the plumbing and hot water heating for a residence at South Somerset for Frank C. Chace.

S. F. GIBSON, Norwich, Conn., is installing a new heating system for C. E. Smith, using a Richardson & Boynton Company's furnace. He is also placing a furnace for John Donovan.

J. WARREN LAMB of Cooperstown, N. Y., bid \$1682 and secured the contract for heating the school building at Middleburg, N. Y.

THE NEW BRITAIN STEAM HEATING COMPANY, New Britain, Conn., have been awarded the contract for equipping the railway station at Worcester, Mass., with a heating system.

FRED. STOYLE of Houghton, Mich., has been awarded the contract for plumbing the new Citizens' National Bank Building in that city.

THE Board of Education of Philadelphia will receive bids until October 29 for heating and ventilating the annex to the boys' school, at Fifteenth and Green streets.

THE Board of Education of New Haven, Conn., will receive bids until November 1 for heating and ventilating the new High School.

THE CITY COUNCIL of Circleville, Ohio, have granted a franchise to a company to construct and operate a hot water system from street mains for heating dwellings and public buildings.

THE COLWELL LEAD COMPANY, 63 Centre street, New York, have just issued a yellow folder printed in two colors, giving the weight per foot of different gauges of Lead Pipe, Tubing, Waste Pipe and extra thick Pipe and Sheet Lead. The weights of pure Block Tin Pipe and Tubing are also given, as well as similar information on Wrought Iron Pipe.

IN the last issue of *Shop Talk*, published by Hill, Clarke & Co. of Chicago, the marvelous Bath Combination Grinder is illustrated and described. It is a machine in which manufacturers of plumbers' brass work will find interest, owing to the great variety of work which it is capable of doing with accuracy and speed.

M. F. DUFFY has been awarded by the Board of Safety of Louisville, Ky., the contract for placing new bathtubs and plumbing in the City Hospital at a cost of \$3745.

SEALED PROPOSALS for the heating and ventilating apparatus for the new High School building on York square, New Haven, Conn., will be received at the office of the Board of Education, 21 Centre street, that city, until Friday, November 1, 1901, at 8 p.m.

D. M. NESBIT of the firm of Ashwell & Nesbitt, Limited, 12 Great James street, London, arrived in this country last week and is visiting friends in the heating trade. Mr. Nesbit has made a number of visits to the United States, where he has made many friends. He takes a keen interest in American systems of heating and ventilation, and American engineers who have visited London speak highly of the extensive work which his firm have done in England.

THE CHADBOURN MFG. COMPANY, Newburg, N. Y., are sending to the trade an attractive pamphlet devoted to their system of automatic ventilating and temperature regulation, which was used on one of the conservatories at the Pan-American Exposition. It contains many testimonials from those who have used their apparatus, in addition to an explanation of the system. Accompanying the pamphlet are circulars showing a view in a greenhouse where the ventilators are operated by their system and giving the names of a large number of greenhouse men who are using it. C. W. Ward of Queens, L. I., is using the system in 43 greenhouses. Another leaflet shows the company's thermostat and also the

valve used in automatically regulating the supply of steam to a radiator. This system is used in a large clothing factory, which is heated and ventilated by an indirect blower system, where it not only governs the use of live and exhaust steam of the main stack heater, but also controls the speed of the engine which operates the blower and effects a direct saving of fuel.

THE DAVIS ACETYLENE COMPANY, 46 South Clinton street, Chicago, Ill., are using an eight-page folder, printed in two colors, to draw the attention of the trade to the Davis Carbide Feed Acetylene Gas plant. This Generator is so constructed that a quantity of fine carbide is charged in a receptacle, from which it is automatically fed to the generating chamber as the gasometer rises and falls, according to the consumption of gas in the lighting system.

THE contract for plumbing the Carnegie Library at Portland, Ind., has been awarded to the Fulton Hardware Company of that town.

QUARTERMASTER A. A. MAYBACH, Fort Terry, N. Y., will receive until November 19 bids for heating and plumbing a barrack building at that place.

THE Board of Directors of the Allegheny Heating Company, Pittsburgh, Pa., one of the constituent corporations of the Philadelphia Company, met October 17 and elected the following officers for the ensuing year: President, James H. Reed; vice-president and general manager, Joseph F. Guffey; secretary, W. B. Carson; treasurer, C. J. Braun, Jr.; auditor and general contracting agent, F. D. Nobbs.

New Firms and Changes.

DRISLANE, MCAULIFFE & GOLDSMITH, are a new firm in the plumbing business at Bellows Falls, Vt.

THE AMERICAN HEATING COMPANY have been incorporated at Kittery, Maine, with a capital of \$1,000,000, of which nothing is paid in, for the purpose of dealing in Stoves, Ranges, and Cremating Devices. The president is Horace Mitchell of Kittery, and the treasurer A. M. Meloon.

THE GILLETTE LIGHTING COMPANY, Chicago, Ill., have been incorporated with a capital stock of \$50,000 by Charles Randolph, John M. Kleppinger and Edward Cahn, for the purpose of manufacturing illuminating and heating devices.

THE FORT PITT MALLEABLE GRAY IRON COMPANY have been incorporated at Pittsburgh, Pa., with a capital stock of \$100,000, by John C. Reilly, Eugene S. Reilly, F. J. Lanahan, John Murphy and Joseph A. Weldon. The new company will manufacture Fittings for the plumbing and steam trade and their works will be located on Penn avenue.

ARTHUR L. MILLER and William Pickard have purchased the plumbing, tin and hardware business of I. W. Miller, at 95 West Main street, Uniontown, Pa.

T. J. MURRAY of Herkimer, N. Y., has closed the plumbing establishment which he has conducted in that place for the past two years.

The first meeting of the Committee of Arrangements for the National Convention on Reciprocity, arranged by the National Association of Manufacturers of the United States, was held at Philadelphia on October 18. It was arranged at the meeting that the convention should open in Washington on November 18, to last three days. Among the manufacturers serving on the Committee of Arrangements were George H. Barbour of the Michigan Stove Company, Detroit; William H. Pfahler of the Abram Cox Stove Company, Philadelphia, and Francis J. Torrance of the Standard Sanitary Mfg. Company of Pittsburgh.

The use of fuel oil for the smelting of ores is a new departure that is being tried in California. Heretofore coke has been considered a necessity in smelting, but a small smelter has just been erected at San Diego to demonstrate the possibilities of oil for this purpose. Iron and copper ores are to be treated. The inventor of the fuel oil smelting process is said to have perfect confidence in its success.

ST. GEORGE'S EVENING TRADE SCHOOL.

The catalogue of the St. George's Evening Trade School of New York for the season 1901-1902 shows that this institution has firmly established itself as a useful agency for the improvement of the boys in that part of the city of New York in which it is located. The school was established in the fall of 1892 as an adjunct of St. George's Episcopal Church. Started on a modest scale in a tenement house on East Eleventh street, it has grown in the interval until it now occupies the whole of a five-story building at 505 East Sixteenth street.

The school opened for the winter season on September 15, and is in session every evening except Saturday and Sunday, from 7.30 to 9 p.m. The course closes the third week in May. A very thorough course of trade instruction is provided, under competent and practical teachers, the departments including wood working, mechanical and free hand drawing, plumbing, printing and manual training. About 250 boys are enrolled as students in the trade classes, as well as 75 younger boys, who are taught in the manual training department. The latter is designed to be a feeder to the regular trade classes. In the plumbing department plumbing, steam fitting and gas fitting are taught, the course covering three years, and leading up from elementary instruction in the use of tools, &c., to the practice of the higher branches of scientific plumbing. Lead burning instruction is given in the third year.

The members of the trade classes are required to take a course in mechanical drawing as an addition to their manual instruction. Theoretical instruction on the different trades is given by means of short talks by the superintendent, Arthur A. Hamerschlag, or the different instructors. Prizes and diplomas are awarded each year at the close of the season to the boys and graduates, and to those who come out at the head of their respective classes. The instruction is given free, the only condition being that the boys shall attend St. George's Sunday school.

The building occupied by the trade school is excellently adapted for the work, although the directors are already taxed for room to accommodate the number of boys who apply for enrollment in the classes, and nearly every class has a waiting list. It has a large assembly room on the ground floor. Above the assembly room is the carpentry department with an extension built on the outside containing toilet rooms. The next floor is divided between the printing and the manual training department. The front part of the fourth floor is given to the plumbing department, the rear half being occupied by the mechanical drawing classes. On the top floor the front is occupied by rooms for the janitor, and the rear has been divided into equal parts, one of which is utilized by the Graduates' or Mechanics' Society, while the other is used for the free hand drawing, wood burning and decorating classes. The building has been equipped with new and modern plumbing from top to bottom and is excellently heated and ventilated. Each night over 300 boys are to be found at work in the building. This season the pressure of application has obliged the directors to limit the attendance of the individual boys to two nights in the week. All the improvements in the new building have been paid for.

The curriculum this season has been improved and extended, and the school is now in a most flourishing condition. At the close of the last season 25 boys were graduated from the various departments, after a three years' course. Superintendent Hamerschlag reports that there is a constantly increasing demand for the graduates of the school among mechanics, builders and manufacturers, and to supply this demand the directors were compelled in a number of instances to recommend undergraduates who, on the whole, have done remarkably well.

THE ROBERT CAMPBELL HEATING COMPANY of New York City were recently incorporated, with a capital stock of \$10,000, for the purpose of manufacturing Heating Apparatus. The directors of the company are: Robert Campbell, John T. Booth and Louis V. Hulse, all of New York City.

The Greatest Exporting Nation.

The United States continues at the head of the list of the world's exporting nations. The comparative figures prepared each month by the Treasury Bureau of Statistics, exhibiting the imports and exports of each of the principal countries of the world and the average per month during a given period, show that the domestic exports from the United States are greater than those from any other country, and that the monthly average during the year 1901 has been higher than that of any other country. For the nine months ending with September, the value of our exports of domestic products was \$1,024,605,181, against \$1,018,845,768 from the United Kingdom, the next largest exporter of domestic products in the same period. While a comparison during the same period with Germany, France, Russia, the Netherlands and India, which follow in the order named in the magnitude of their exports, is impracticable because their fiscal years are not continuous with that of the United States, the totals of their exports during the latest available years show not only that the United States is clearly in the lead as an exporter, but that the growth in her exports has been more rapid than that of any other great exporting nation. In the calendar year 1900, for which the statistics of most exporting countries are now available, the figures for the United States were \$1,453,013,659 of exports of domestic products, against \$497,263,737 in 1875, an increase of nearly 200 per cent. during that period; while those of Germany in 1900 were \$1,050,611,000, and in 1875, \$607,096,000, an increase of 73 per cent., and those of the United Kingdom, in 1900, \$1,418,348,000, and in 1875, \$1,087,497,000, an increase of about 40 per cent.

The very latest available data for comparing the commerce of the United States with that of other countries, however, are furnished in a statement just prepared by the Treasury Bureau of Statistics, which shows the monthly exports of domestic merchandise from each of the principal countries of the world during that period of its fiscal year for which statistics are available. This shows that the monthly average for the United States is greater than that of any other country, and that the figures of 1901 show in the case of the United States a material increase over those of 1900, while those of the United Kingdom and Germany show a decrease. The average monthly exportation of domestic merchandise from the United States in the nine months ending with September, 1901, was \$113,935,020, against \$112,529,440 in the corresponding months of last year, an increase of about \$1,500,000 per month; while those of the United Kingdom were in the same months of 1901, \$113,205,085, against \$118,132,533 in the same months of 1900, showing a decrease of about \$5,000,000 per month; and those of Germany were \$87,831,833 per month for the six months ending with June, 1901, against \$88,520,833 for the corresponding months of the preceding year, showing a decrease of a little less than \$1,000,000 per month.

The Production of Zinc in 1900.

The United States Geological Survey have issued in pamphlet form the annual report, by Charles Kirchhoff, of the production of zinc in the United States in 1900, which shows that during the past year the production of spelter in this country receded from the high point which it reached in 1899. The year 1900 was one of restricted consumption, the galvanizing trade in particular having suffered largely owing to strikes. The total production of spelter in the United States for the year 1900 is placed at 123,886 short tons, as compared with 129,051 short tons in 1899. Of this amount 8259 tons were produced in the Eastern and Southern States, 38,750 tons in Illinois, 62,136 tons in Kansas and 14,741 tons in Missouri. The figures show that the production in Illinois declined one-half during the second half of 1900, which was due mainly to strikes. Kansas gained rapidly, and the center of production for spelter has shifted to the gas belt of that State. Production in the Eastern and Southern States declined. The energetic develop-

ment of the mining and concentrating operations of the New Jersey Zinc Company and the building of a large new reduction plant promise, however, a considerable increase from that quarter in the future.

A number of Western producers increased their capacity during the year, especially in the Kansas district. In the early part of the year the American Sheet Steel Company assumed control of the Girard Works, at Girard, Kan. Since the American Steel & Wire Company, another of the constituent companies of the United States Steel Corporation, own the works of the Edgar Zinc Company, at Cherryvale, Kan., and at Carondelet, near St. Louis, the steel corporation is the second largest producer of spelter in the country, the Lanyon Spelter Company being the largest. In 1900 the plants controlled by the United States Steel Corporation made nearly 25,000 short tons of spelter, or one-fifth of the total output of the country. The corporation do nearly all the galvanizing of staple iron products in the country, and are therefore very large consumers of spelter.

The production of sheet zinc absorbs a large share of the output of the Illinois smelters, the quantity being about 18,000 to 20,000 short tons per annum. The capacity for the production of sheet zinc will be considerably enlarged. The New Jersey Zinc Company are building a rolling mill, and the Lanyon Zinc Company have broken ground for a plant at La Harpe, Kan.

In 1900 the United States, for the first time, became a really important contributor to the world's markets of zinc as an exporter of both metal and ore, sending out 22,000 short tons. Adding together these exports with the 18,000 to 20,000 tons used in the production of sheet zinc, and the 25,000 tons produced and consumed by the United States Steel Corporation, there are thus accounted for 65,000 to 67,000 short tons out of a total production of 124,000 short tons, or more than one-half. The additional purchases of the steel corporation, the requirements of outside galvanizers, the consumptive requirements of the brass trade and the small amount called for by the leading desilverizers, which together represent what is taken in the open market, were less than one-half of the output of 1900. Most of the zinc exported is the high grade spelter of New Jersey, Pennsylvania and Virginia. Western spelter is also shipped by way of the Gulf ports, and a small quantity goes to the Canadian market. The United Kingdom takes the bulk of our spelter, being the heaviest consumer of foreign zinc.

CHANGES IN THE AMERICAN TIN PLATE COMPANY.

D. G. Reid has resigned as president of the American Tin Plate Company, and Warner Arms as second vice-president. Mr. Reid gives up the active conduct of the affairs of the company in order to devote his entire time to the duties of his position as a member of the Executive Committee of the United States Steel Corporation, and Mr. Arms to gratify a long expressed desire to rest from the exacting duties of active business after more than 30 years' continuous service. The vacancies occasioned by these changes have been filled by the election of the following named gentlemen: W. T. Graham, president; W. M. Leeds, first vice-president; Frank Dickerson, second vice-president. In connection with the office of second vice-president, Frank Dickerson will still retain his position as general sales agent of the company.

It is seldom that any city has in course of erection such a number of splendid new buildings as are now rising in New York. No less than six public structures of the first importance are in course of erection in the city. These are the Cathedral of St. John the Divine, the New York Public Library, the Custom House, the Hall of Records, the Chamber of Commerce and the Stock Exchange. Each of these buildings will form a notable addition to the architecture of New York, and will emphasize its standing as the metropolis of the Western Hemisphere.

Pattern for Elbow Springing from Pipe.

A correspondent in New Hampshire desires to know how to cut a pattern for an elbow springing from a straight pipe, a general view of which is shown in Fig. 1, where A is the vertical pipe and B the elbow springing from it. In this connection it is proper to remark that no matter what may be the diameter of either pipe, or whether the elbow be placed in the center of the vertical pipe or to one side of it, the principles to be explained will apply in any case.

To avoid a confusion of lines the elbow is made of a

parts as the profile in plan, being careful to number the top 4, while in plan the top is numbered 1. Assuming that I P in elevation is the axis of the profile I R P, the point 1 at R would, if the half circle were turned toward the reader, represent the side which is shown in plan by 1 and 1, while 4 and 4 in elevation would represent the top and bottom, as shown by 4 and 4 in plan. At right angles to I P in elevation and from intersections 1 to 4 in the profile draw lines as shown, intersecting I P, as shown by points 1° to 4° on I P. At right angles to I P and from points 4 and 3° draw lines intersecting the vertical lines 4' and 3' drawn from plan, as shown by intersections 4'' and 3''. In similar manner, from points 2°, 1°, 2x, 3x, and 4, draw lines at right angles to P I, intersecting the miter line, J O, as shown. Parallel to

Fig. 2.—Plan, Elevation, Profiles and Shape of Opening in Vertical Pipe.

Fig. 1.—General View of Article for which Pattern is Required.

PATTERNS FOR ELBOW SPRINGING FROM PIPE.

larger diameter in Fig. 2 than desired, the principles being the same in either case. Referring to the diagram, let A B C D be the elevation of the vertical pipe, shown in plan by E F G H, and let I J K L M N O P show part of the elbow minus the intersection, the half profile of the elbow being shown by P R I. From the center point Y in plan draw the horizontal line Y T, and from any point, as Z, and with radius equal to 1° P in profile in elevation describe the circle T S U V. Divide the half circle S T V in plan into equal spaces, as shown by the small figures 1 to 4, &c. As the profile in plan is central in line with the cylinder each quarter circle is equally numbered. From points 1 to 4 draw lines parallel to T Y intersecting the plan of the vertical pipe, as shown from 1' to 4'. Now, at right angles to T Y and from intersections 1' to 4' carry vertical lines upward through the elevation of the vertical pipe, as shown. Divide the half circle P R I in elevation into similar

J K or O N, and from the points 2 and 1 on J O, draw lines intersecting the vertical lines in elevation of similar numbers, as shown by points 2'' and 1''. From the balance of the intersections on J O draw lines parallel to O N, intersecting the miter line K N at 2, 3 and 4. Then from these intersections and parallel to K L or N M draw lines intersecting vertical lines of similar numbers, as shown by 2''', 3''' and 4'''.

Before drawing the miter line through the points of intersection on the vertical lines in elevation it will be necessary to know where this miter line will intersect the miter lines of the elbow J O and K N. Therefore partial horizontal sections will be required on the lines J O and K N, for which proceed as follows: From the points of intersection 4, 3, 2, 1 on the miter line J O in elevation drop vertical lines, not here shown, intersecting horizontal lines of similar numbers in plan, as shown by intersections a, b, c and d. Through these

points trace the quarter elliptical figure, as shown, intersecting the circle in plan at *e*, being the point desired. From *e* draw the vertical line upward intersecting the miter line *J O* in elevation at *e'*. In similar manner, from the intersections 1, 2, 3 and 4 on the miter line *K N* in

For the pattern for the opening to be cut into the vertical pipe proceed as follows: In line with *B C* in elevation draw the line *C W*, upon which place the stretch-out of 1', *k*, 2', *e*, 3' and 4' in plan, as shown on either side of the line *C' A'* by 1, *k*, 2, *e*, 3, 4, 3, *e*, 2, *k*, 1 on the line *C K*. At right angles to *C K* and from these points carry lines upward, which intersect with lines drawn from points having similar letters and figures in the miter line in elevation at right angles to *D C*, as shown. Trace a line through points thus obtained in the pattern; then will *A' B' C' D'* be the pattern for the opening in the vertical pipe. From the point *k'* in elevation and parallel to *J K* draw a line intersecting the miter line *J O*. From the intersection thus obtained and from *e'* draw lines parallel to *J I*, intersecting the line *I P*, and cutting the semicircle at *e''* and *k''*.

For the pattern for the three pieces in the elbow, and to avoid a confusion of lines, take a tracing of 1, 4, 4'', *e'*, *k'*, 4''', *N*, *O*, 4 and 1 in elevation and place it as shown by similar figures and letters in Fig. 3, the line 4 4' being

Fig. 3.—Patterns for Elbow Pieces.

PATTERNS FOR ELBOW SPRINGING FROM PIPE.

elevation drop vertical lines, not here shown, intersecting horizontal lines of similar numbers in plan, as shown by *f*, *h*, *i* and *j*. Trace a quarter elliptical figure through these points, as shown, crossing the circle in plan at *k*, the desired point. From *k* draw a vertical line upward intersecting the miter line *K N* in elevation at *k'*. Now through the intersection in elevation draw the curved line from 4'' to *e'*, *e'* to *k'* and *k'* to 4''', which represents the line of joint between the elbow and vertical pipe.

placed vertically. Then for the pattern for the piece *A* draw the line *D J*, upon which place the stretch-out of twice the amount contained in the semicircle 4 1 4', as shown from 4 to 4' on the line *J D*. Obtain the point *e* in the semicircle and place it between the points 2' and 3', on either side, on the line *D J*. From these points and at right angles to *D J* draw lines, which intersect with lines drawn from similar numbers in the miter lines *O*, *e'*, 4', parallel to 4 4'. A line traced through

points thus obtained, as shown by D E F G H J, will be the pattern for one piece of the elbow, marked A.

For the pattern for the piece B draw the line L M at right angles to N O, upon which place the stretchout of twice the amount contained in the profile from e to 4, as shown from e to e on the line M L, being careful to obtain the point K in the profile, and place it on M N, as shown. At right angles to M N and through the small figures draw lines, which intersect with line drawn from intersections of similar numbers on e' O, N k' and $k' c'$ at right angles to O N. Trace a line through points thus obtained; then will P R S T be the pattern for part B of the elbow.

For the pattern for part C draw the line U V at right angles to N 4", upon which place the stretchout of twice the amount contained in the profile from k to 4, as shown from k to k on the line U V. At right angles to U V and through the small figures draw lines, which intersect with lines drawn from intersections having similar numbers on k' N and 4" k' at right angles to N 4". A line traced through points thus obtained, as shown by W X Y, will be the pattern for part C.

Laps should be allowed on all patterns for riveting and seaming.

The Amalgamated Association.

Reports from Pittsburgh intimate that the officials of the Amalgamated Association of Iron, Steel and Tin Workers are planning a general reorganization, for the purpose of strengthening the association after the loss in membership sustained in consequence of the recent strike. The national officers are said to have come to the conclusion that the strike was lost largely by reason of the fact that the men in the inferior positions in the mills were able to take up the skilled work and fill the places of the Amalgamated men. The new policy of the association will be to take in all the mill workers and make them a part of the organization, so that the interests of all will be identical. These changes cannot take place before the next annual meeting to be held in the spring. In the meantime the Executive Board will prepare plans covering the proposed new arrangement. Changes will be necessary in the constitution and by-laws of the association before the unskilled workers and laborers in the mills can be admitted into membership in the association.

New Sheet Rolling Process.

Joseph W. Keefer and Charles B. Cushwa, of Pittsburgh, Pa., have patented a method of rolling sheet metal which does away with a number of the reheatings employed in the ordinary process and also with the many manipulations and handlings, while the cost of production is reduced. The new process is thus described by the *American Manufacturer*:

Heating furnaces are provided wherein the ingots, billets or slabs are heated to a rolling temperature. From these furnaces the heated ingot, billet, or slab is transferred to a feed table of a rolling mill, being either a two-high reversing mill or a three-high mill, the latter preferred, the mill being provided on its rear side with another feed table. The heated ingot, billet, or slab is passed back and forth through this mill in the usual manner until it is reduced to a plate of approximately the width of the sheets to be formed and from about $\frac{1}{8}$ to $\frac{1}{4}$ inch thick, depending upon the gauge of sheet plate to be produced, the rolling of this gauge from the ingot, billet or slab being accomplished at a single heat. From this mill the plate is conveyed along a table to a shear where it is sheared into sections of suitable length for convenient piling and rolling. These sections of plate are then formed into piles consisting of two, three or more, depending upon the gauge of sheet plate to be produced, and are fed into a continuous reheating furnace, the furnace being of a well known construction, wherein the plates are fed in at one end, carried through and removed from the other end. The piles or packs are heated in a furnace to a suitable rolling temperature, and then two or more such piles or packs are entered simultaneously into two or more parallel continuous or

tandem mills. Two such mills are preferably used, each of which comprises four stands of rolls, with suitable guides between the same; but either more or less than four stands may be used, if necessary or desired. From these mills the reduced packs pass simultaneously upon two feed tables, and the pack or pile on one of the tables is transferred in any manner over to the other table and placed on top of the pack on the table. When the packs or piles leave the tandem mills, they have been reduced to as thin a gauge as is possible owing to the spring of the rolls and the slack in the adjusting means of the last stand of rolls in said mill, and a further rolling of these packs singly would not result in any material further reduction of the same, due to the slack and spring of the rolls and their adjusting means. Consequently the reduced packs or piles are assembled one on top of the other, as stated, and being still at good rolling temperature, are passed through another continuous or tandem mill, the same comprising two or more stands of rolls, as necessary, with suitable guides between, and in this mill the double packs are further reduced successively in the different stands, and the spring in the rolls and the slack in the adjusting means of the last stand will not be so great as to prevent the packs being brought to the desired gauge.

The packs are then conveyed by live rollers and endless chains or any other convenient conveyor to two shears, where they are sheared to the desired size, after which they are opened up in any way and the sheets conveyed by live rollers to cold rolls, through which the sheets are separately passed to smooth down the surface and finish the same. The sheets as they leave these rolls are again piled, preferably on the bottom plate to an annealing box, and when sufficient sheets have been piled thereon they are conveyed by a crane or similar device and placed in the annealing furnace and subjected to the ordinary annealing process.

"When a Roof is Not a Roof."

All who do tin roofing will be more or less interested in the methods adopted by Gara, McGinley & Co., 23 South Seventeenth street, Philadelphia, for extending their roofing business. We have just received from them a little four-page illustrated pamphlet with the above title. A half-tone engraving on the front cover shows a comfortable home, and one on the back shows the ceiling fallen, as the result of a leaky roof, with numerous pans, buckets and other vessels occupying different places on the floor to catch the downpour. This is well calculated to attract the attention of the recipients of the pamphlet to the condition of the roof, whether tin, tile, slate or slag. Inside the cover is a quotation from Benjamin Franklin to the effect that "In a permanent structure a good roof is only second in importance to a good foundation." A feature of the pamphlet is a piece of tin plate taken from a roof, showing the marks of rust on the under side and poor painting on the upper side. The text raises the pertinent question whether or not the roof of the owner addressed may not have been affected by the "noiseless gnawing of the tooth of time," as shown by the sample. It also explains that the firm make a specialty of examining roofs, spouts and gutters with a view to putting them in proper order. Accompanying the pamphlet is a private mailing card already stamped so that those who receive it may order the inspection of their roofs. A slip is pasted to this card pointing out that a new tin roof or gutter should be painted as soon as completed, and should receive another coat of paint one year afterward, another at the end of three years, and thereafter as often as required. The last page gives a bird's-eye view of the roofs of Philadelphia, four-fifths of which are said to be covered with tin. The statement is made that the house have had an extensive experience with all kinds of roofings, and are prepared to replace or repair, using only the best materials. The character of this advertising matter shows that even such a subject as tin roofing may be brought to the attention of property owners in an entertaining and attractive manner, and that an increased trade may be attracted to those who adopt such methods.

FLASHINGS.

THE STARK ROLLING MILL COMPANY, Canton, Ohio, have made a successful start of their new Sheet mill. The plant consists of four Sheet mills and a Bar mill. The company are closely allied with the Berger Mfg. Company, which concern will use a large part of their product in the manufacture of their various Sheet Metal specialties.

JOHN JARRETT, head of the Labor Bureau of the American Sheet Steel Company, has returned to Pittsburgh after a trip to Europe for the benefit of his health.

RUMORS have been revived of the contemplated absorption of the American Can Company by the United States Steel Corporation. Ever since the formation of the Can company the conviction has prevailed that in the course of time the concern would be amalgamated with the Steel Corporation. A majority of the directors of the company are also directors of the various constituent companies of the United States Steel Corporation, and the relations of the Can company have always been of the closest with the American Tin Plate Company. It is estimated that the Can company consume about 50 per cent. of the total output of the Tin Plate made by the American Tin Plate Company.

GUMMEY, McFARLAND & Co., Philadelphia, Pa., are displaying at their office a piece of their Pennsylvania Old Method brand of Roofing Tin, which had laid on the ground for 18 months, unprotected by paint or any other means, without showing any sign of rust or deterioration. This piece of Plate was from a lot used on the roof of a boat house at Runnemede, N. J. It speaks well for the wearing qualities of the brand of Tin Plate mentioned.

THE Burger plant of the American Can Company, in Jersey City, N. J., was destroyed by fire on the evening of Friday, October 18. The loss is estimated at about \$75,000, half of which is covered by insurance. The plant was a four-story frame structure, 120 x 60 feet. The stock and machinery of the Beggs Can Company was recently removed from New York City to the Burger plant and has consequently been lost. A considerable stock of Tin Plate was stored in the factory at the time of the conflagration.

THE EAGLE CAN COMPANY of Huntington, L. I., have been incorporated with a capital stock of \$50,000 by A. M. Dickson, A. E. Stacy and J. T. Bergen of Brooklyn, N. Y.

THE PRAIRIE & SHOEMAKER TIN, SHEET IRON & COPPER WORKS are a new concern that have started in business at 3424 State street, Chicago.

EDWARD E. ERIKSON of Pittsburgh, Pa., has been awarded the contract for a heating furnace for the Ashland Sheet Mill Company, who are putting up a four-mill Sheet plant and a Bar mill at Ashland, Ky.

THE LAUGHLIN plant of the American Tin Plate Company, at Martin's Ferry, Ohio, had all of its 23 hot mills in operation last week.

THE LICKING ROLLING MILL COMPANY, Covington, Ky., have purchased a tract of land adjoining their works and will erect thereon a corrugating plant as an addition to their equipment.

THE WEST CARNEGIE SHEET STEEL COMPANY is the name of a new concern that will be incorporated shortly by George W. Wilson, D. R. Torrance, Joseph R. Paull, W. H. Skivington and G. N. Chalfant of Pittsburgh, to build a Sheet mill near Carnegie, Pa.

THE NATIONAL TIN COMPANY of Detroit, Mich., have been organized with a capital stock of \$100,000 to make Tin Cans and Boxes. The officers are: Theo. D. Buhl, president, and Fred. T. Ducharme, secretary. These, together with William M. Warren, Frank W. Eddy, E. H. Nelson, David M. Ireland and Fred. E. Wadsworth, form the Board of Directors.

It is reported that parties are in correspondence with the Commercial Club of Louisville, Ky., relative to the establishment in that city of a plant for the manufacture of Sheet Iron by a new process.

THE W. H. GRIFFITHS COMPANY, who are erecting a five-mill Tin Plate plant at Waynesburg, Pa., expect

to have the new works in operation before January 1. The foundations for the mills and machinery are about finished and work will be actively prosecuted on the completion of the plant.

THE DOWMAN COMPANY, Atlanta, Ga., have just taken the contract for the Sheet Metal work on the Peters office building in that city. The company have in hand a large number of orders for their Dixie Ventilators and Hot Air Furnaces.

It is reported from Loudon that negotiations are on foot for the amalgamation of the Tin and Sheet Mill Men's Union and the Smelters' Union, which are the two labor organizations which the Tin Plate workers of South Wales joined when the Tin Platers' Union was dissolved some little time ago.

On the organization of the American Tin Plate Company and the American Sheet Steel Company agreements were entered into with the manufacturers of Tin Plate and Sheet mill machinery, which guaranteed to the latter a certain amount of business, in consideration of which no mill equipment was to be sold by them to independent concerns. These agreements, it is understood, will now be canceled by the United States Steel Corporation and no more subsidies will be paid to the machinery and roll manufacturers. The only effect of the arrangement was to encourage the starting up of new foundry and machinery plants, so that the agreement proved to be of little value to either party.

It is stated that instead of removing their Johnstown, Pa., plant, the American Tin Plate Company will enlarge and improve it at a cost of about \$250,000.

THE TUSCORA STEEL COMPANY are building a four-mill Sheet plant and Galvanizing works at Newcomers-town, Ohio. The company have received from the town a cash bonus of \$30,000 and a free site for their works.

THE EDWARDS MFG. COMPANY, manufacturers of Artistic Sheet Metal Work, Architectural and Ornamental Statuary, Zinc and Copper Spun Work, &c., have removed their office from Covington, Ky., to 119 Sycamore street, Cincinnati, Ohio, where they have established a factory for the manufacture of Cornices of all kinds. They expect to operate both plants and would be pleased to send their catalogue to those interested.

THE GRIFFITHS CHARCOAL IRON MILLS, Washington, Pa., have let contracts for two hot and two cold mills, together with a Bar mill and forge and eight knobbling fires, for making Charcoal Iron and reducing it to Sheets for Tin and Terne Plates. Work has been commenced on the plant, and it is expected to be in operation early next year.

THE WOODCOCK CAN COMPANY, Chicago, were incorporated in Illinois last week with a capital stock of \$3500 to manufacture Tinware and Sheet Metal goods. The incorporators are John T. Woodcock, Charles P. Woodcock and J. H. Ghiselin.

THE SEIBEL-SUEDSDORF COPPER & IRON MFG. COMPANY, St. Louis, Mo., manufacturers of Perforated Metal, have been incorporated with a capital stock of \$25,000.

THE WAUKESHA SHEET STEEL COMPANY of Waukesha, Wis., are pushing the erection of their boilers, so as to start the new plant by November 5.

It was announced from Pittsburgh that President Shaffer of the Amalgamated Association was to come to New York City at the end of this week to consult with the officials of the American Tin Plate Company in regard to some minor scale complications which have arisen in several of the company's plants.

H. WEISS & Co., 20 Cliff street, New York, are sending to the trade a price-list of their Skylight Gearing Specialties, adapted for the opening and closing of Skylight Ventilators and Ventilators in greenhouses or any class of buildings. The back of the circular presents cuts showing the various parts used in the apparatus.

To keep iron nails, used in wooden construction work, from rusting after a few months' exposure, a contemporary advises, heat the nails to a cherry red and throw them quickly into a pot of raw linseed oil, then drain off the oil, and let the nails become fairly dry before using.

THE LETTER BOX.

Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.

Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.

FASTENING CORRUGATED IRON ROOFING.

From J. H. Eller & Co., Canton, Ohio.—In answer to the inquiry of "O. C. R.," in *The Metal Worker* of October 19, we would say that the usual method of fastening corrugated sheets to the steel frames, or to

Fastening Corrugated Iron Roofing.—Sketch Submitted by J. H. Eller & Co.

roof trusses, is to use a clamp or clip made of ordinary band iron. This should be of sufficient length to be riveted at each end to the corrugated iron after it has passed around the angle iron or I-beam, whichever may be used, as shown in the illustration herewith.

From the New York Roofing & Corrugating Company, Jersey City, N. J.—Replying to the inquiry of "O. C. R.," in *The Metal Worker* of October 19, as to the best way of fastening corrugated iron roofing, we would say that clamps are made from hoop iron, especially adapted to the angle iron, I-beam, or tee beam, on which the roof must lie. The sketch herewith shows such a clamp made from hoop iron, about $\frac{1}{8}$ inch thick and 1 inch wide, and bent so that one end will catch under the web of the beam. The other end should be

Fastening Corrugated Iron Roofing.—Sketch Submitted by New York Roofing & Corrugating Company.

fastened to the roof by means of a rivet. In doing this kind of roofing it is necessary to have two men—one underneath to put the clamp in place and arrange for the hole to be punched for the rivet, and then to hold a square head stake or other suitable weight under the head of the rivet, so that the man above with the hammer can do the riveting. These clamps can be made in any shape required and bent in the ordinary cornice makers' brace bender. All that is necessary is to punch a hole in one end for the rivet, and in light material this would be no difficult task in the ordinary cornice shop.

From the Berger Mfg. Company, Canton, Ohio.—In answer to the inquiry of "O. C. R.," in *The Metal Worker* of October 19, we present herewith a sketch showing a good way of fastening corrugated sheets to a steel building. It will be seen that one end of the clamp is riveted to the roof and the other end bent around the angle iron. After the size and shape have

been determined, these clamps can be punched with facility in the shop. In fact, if the size of the iron frame

Fastening Corrugated Iron Roofing.—Sketch Submitted by Berger Mfg. Company.

of the roof support is known, they should be made before going on the roof.

From W. N., New York.—Replying to your correspondent, "O. C. R.," of Grand Forks, B. C., whose inquiry appeared in *The Metal Worker* of October 19, on fastening corrugated roofing to steel rafters, I show herewith the clamp we use in practice on work of this kind, whether it is roofing or siding. In Fig. 1 let A

Fastening Corrugated Iron Roofing.—Fig. 1.—Section Showing Roof, Angle Iron and Clamp.—Submitted by "W. N."

represent the angle iron and B the corrugated sheet; a clamp shown at C, made of flat iron 1-16 x $\frac{1}{2}$ inch, has a loop at D to fit the angle A tightly and a flange at the top, which is riveted to the highest point of the corrugation by the rivet E. Fig. 2 shows the clamp, which is cut to the required length, punched to fit the rivet in

Fig. 2.—General View of Clamp.

use, and then formed to fit the size of the corrugation in use at the top, and the proper length and loop to fit the rafter or angle at the bottom.

COPPER STOVE RESERVOIR.

From G. W. G., Pawling, N. Y.—Will you please describe the correct and quickest way to make a copper stove reservoir out of 14 x 48 inch sheet copper, with two seams in the body? The finished reservoir is to be 12 inches deep, 17 x 10 inches at the top and 16 x 9 inches at the bottom.

Answer.—Assuming the body is to be in two pieces, with seams at two corners, it will require using stock size of 14-inch wide copper, a length of 28 inches for each half pattern. As we understand out correspondent's question, he desires the correct rule for laying out the pattern direct upon a sheet of copper without using any drawings but the measurements above given. In Fig. 1 let A B C D represent a sheet 14 x 28 inches in size; draw the line E F parallel to A B, making the distance A E equal to the width of the top flange, and place E from the edge A D as much as required for edges for seaming. Make E F equal to 17 inches and bisect the line as at G. From G at right angles to E F draw G H, equal to 12 inches, and from H parallel to E F

draw I J, making H I and H J each equal to 8 inches, making I J 16 inches; draw lines from E to I and F to J. Then will E F J I be the pattern for the long side. As the flare is equal all around, then, with F as center and any radius, describe the arc K L, intersecting the line F J at M. With M as center and M K as radius inter-

Copper Stove Reservoir.—Fig. 1.—Body Pattern.

sect the arc K L at L. Draw a line from F through the intersection L, as F R, which make equal to 10 inches. In similar manner the angle P O can be made equal to P N; or, from J draw the line J S parallel to F R, making J S equal to 9 inches, and draw line from R to S. Then will E F R S J I represent a one-half pattern for the reservoir, flanges to be allowed for seaming. It will be noticed we have made the distance from G to H 12 inches, or the depth of the article, because in this case the flare, as shown from B to C in Fig. 2, is but 1-32 inch more in length than the straight height. If, however, the flare was greater, the distance from B to C would be the length from G to H in Fig. 1. In Fig. 2 is shown the section through the article with flanges at A and B and double seams at the bottom at C and D. If desired the

Fig. 2.—End Section.

corners can be slightly rounded. We would suggest that 28-inch wide copper be employed; as that is stock size, no waste will result.

TROUBLE WITH ACETYLENE APPARATUS.

From D. M. W., San Antonio, Texas.—We desire a little information in reference to a troublesome acetylene gas plant in this vicinity. Some time since a 20-light machine was installed in a church not far from us. The church building is 45 x 54 feet, having 14-foot side walls, and the ceiling is arched so that it measures 25 feet high in the center. Twelve lights were placed in the building in six drops equally distributed, so that the lights are about 9 feet above the floor, and are said to carry a 24 candle-power burner each, with ordinary street gas globes around them. The lights do not give satisfaction for the following reasons: The room is full of shadows, although a person can read fairly well, and occasionally one of the burners sputters and smokes. But the most objectionable feature is that one or more of the burners are continually hissing, making a sound like the escape of steam. The noise comes from different burners alternately.

Knowing a little about gas fitting, after serving a full apprenticeship time in a European country, we think the capacity of generators in use there in cubic feet of space in the gasometer is exactly 50 per cent. larger for a given number of lights than most of the generators

used in this country, including the generator used in the church mentioned. We have made it a rule in everything that we make to provide ample capacity, making it rather too large than too small, and to use the very best fittings obtainable. The result has been always satisfactory to all concerned. The main feed pipe in this church lighting apparatus is only $\frac{1}{2}$ inch, while we claim that it should have been at least $\frac{3}{4}$ inch. In our opinion the trouble at the church is due, first, to the generator being too small; second, the main feed pipe is too small; third, the burners and globes are of a cheap grade. This makes the lights dull and is the cause of the shadows. The hissing noise and the sputtering of the burners, we believe, is caused by the generators being worked to the fullest capacity, thereby making hot gas, which will carbouize and clog up the pipe.

The generator used is of the kind with a basket for carbide fastened inside the bell of the gasometer, the gasometer itself for 20 lights being only 27 inches by 30 inches deep. The basket takes up a space 7 inches by 18 inches deep. The machines that we use have the generators separate from the gasometer, and the gasometer has 50 per cent. more capacity for the same number of lights. The plant was installed by a friend whom we believe to be an expert, having had 15 years' experience as superintendent of the city gas works, and who has put in a number of acetylene plants with good results. He is of the opinion that the job will work satisfactorily within a few weeks. What we wish to learn for our own benefit is what causes the trouble mentioned, and if our theory of the case is correct. We are very anxious always to be certain of success before entering upon any piece of work. Being connected with this particular church, the job was offered us. We did not accept it, as we do not desire to do any work where we have to follow nonmechanical instructions, as was necessary in this case.

Answer.—The problem of our correspondent has been submitted to Augustine Davis, an expert on acetylene lighting and apparatus, who has prepared the following explanation of the causes of the poor service rendered by the system described:

The first trouble is due to this type of generator being antiquated and out of date. No progressive generator maker now constructs a machine in which the carbide is carried by the bell, as it has inherent deficiencies which are impossible to overcome. In the next place, the amount of light is insufficient even were it produced under the most favorable conditions. The rule in store lighting is to place one $\frac{1}{2}$ -foot burner for every 100 square feet of area. Under this rule the church would require 24 burners, with no higher ceiling than a mercantile room. But the average light of the church ceiling is about double that of the business place, so that the amount of light should be increased. Shades or deflectors that would throw the light downward would undoubtedly obviate the trouble to some extent.

The hissing noise is undoubtedly caused by irregularity of pressure in the machine, caused by the gas holder not moving smoothly, or possibly from air mixture. The sputtering is caused by condensation occurring in the burners, a condition which does not exist when the gas is properly condensed and purified. A continuous snapping and popping in the burner is caused by little leaks in the burner itself.

The $\frac{1}{2}$ -inch pipe is ample to supply the amount of acetylene gas consumed. Poor globes and burners are unquestionably a detriment, but even the best burners would in all probability quickly clog and smoke with the method of generation employed. Generators are constructed with gas holders only 17 x 24 inches, which supply 25 lights perfectly, but they are built in accordance with the latest ideas and are the result of long and continuous experience. It is not stated how the generator in question is charged. If the recharging admits a considerable amount of air, this would for some time have a tendency to produce dullness of light and reduce the amount. The piping is about the only thing in connection with the whole plant which is conducive to good illumination. Larger burners would, of course, increase the light.

TRADE REPORT.

MARKET SUMMARY.

Pig Tin is dull and lower.
Copper is quiet and unchanged.
Pig Lead continues dull and prices firm.
Spelter is dull and firm at last week's prices.
Antimony is unchanged.
Nickel continues at former prices.
Aluminum is active and unchanged.
Tin Plates are in good demand for spot delivery and still scarce.
Sheets are still in good demand, with prices strong and supply short.
Old Metals are more active, with no change in price.
Sheet Copper is in good demand and firm in price.
Foundry Iron is moving in good volume; prices are strong.
Hardware continues in active demand, with prices firm in most lines.
Russia Iron is scarce and higher.
Tacks are higher in price.
Poultry Netting has been advanced slightly.
Wire Nails are active, with some irregularity in prices of competitive mills.
Cut Nails are in moderate demand, and without change in price.
Wire is still in heavy demand, and prices rule firm.
Set and Cap Screws were reduced 10 per cent. in price.
White Lead is active and unchanged.
Linseed Oil is scarce, with firm prices.
Spirits Turpentine is quiet; supplies are light.

METAL MARKET.

NEW YORK, October 25, 1901.

Pig Tin.—For reasons mentioned in our last report the market for Pig Tin continues very quiet, so far as consuming business is concerned. The speculative interest is also very tame. Large consumers are well supplied for the balance of the year and are not disposed to buy any further ahead until they can see the course of the market more clearly, and only the smaller ones are now purchasing. Prices have not varied much during the week, but rule slightly lower than at the time of our last report. Straits Pig in small lots is quoted at 25½c. to 26c. per lb.

Copper.—Despite numerous press reports regarding large sales and increased activity the situation in Copper is absolutely unchanged. None of the large consumers are buying into the future. In regard to the buying for small account the demand was of smaller proportions than last week. Prices are unchanged, the small consumers being obliged to pay the full market figures asked by the large producers. Lake Ingot in small lots is quoted at 17¼c. to 17½c. per lb., and Casting Copper at 16¾c. to 17c.

Sheet Copper.—There has been no change in the general situation of this material. The demand continues of fair proportions, and prices are firm on the basis of 21c. per lb. for moderate sized lots from store.

Pig Lead.—Business in this market continues very dull. The volume of transactions during the week has been light. Prices are unchanged. American Pig in small lots is quoted at 4.62½c. to 4¾c. per lb. St. Louis advices indicate a quiet and steady Pig Lead market, with prices remaining the same.

Spelter.—The upward movement in Spelter has received a check and the market has been dull, at prices unchanged from those quoted last week. There is certainly no scarcity of the metal indicated in the St.

Louis reports. Good Western brands in small lots are quoted at 4.55c. to 4.60c. per lb. St. Louis advices report a strong market for Spelter, with prices firm and having a tendency to work higher.

Sheet Zinc.—No change has occurred in the market for this material. Jobbers are quoting 600-lb. cask lots at 6¾c. per lb. and smaller quantities at 7c.

Antimony.—Is unchanged. Hallett's in small lots is quoted at 8½c. to 9¼c. per lb., and Cookson's at 10½c. to 11c.

Nickel.—No change is reported in this metal. Prices for small lots continue at 60c. to 65c. per lb.

Aluminum.—The demand for Aluminum continues active and prices remain at 37c. per lb. for small lots of No. 1 Ingot guaranteed 99 per cent. pure, and 35c. for 100-lb. lots.

Tin Plates.—Owing to the fact that all of their mills are filled completely up to the first of the year, the American Tin Plate Company are quoting only for the first quarter of 1902. Their quotations remain unchanged from those prevailing for some months past. New business is not so plentiful as it was this time last year, but deliveries are naturally much heavier, owing to the accumulation of orders during the strike period. Vegetable canners will probably run 25 per cent. behind their usual pack this year, consequently the demand from this quarter is comparatively light. Other industries using Tin Plates are apparently very busy, as the demand for prompt and early delivery is good. Stocks in second hands do not as yet show any material increase, Coke Plates being particularly scarce in this market. Jobbers have reduced their price on Bright Charcoal Plates about 25c. per box. While retail quotations are still merely nominal, a fair average quotation for American Bessemer Coke Plates, I C, 14 x 20, delivered in moderate sized lots in New York or corresponding points, would be \$6.50 to \$6.75 per box.

Sheets.—The mills are making somewhat better deliveries of both Black and Galvanized Sheets, but are still far behind on contracts. Large orders for Sheets have been entered by the mills for next year at prices which are in effect by the leading interests at the time shipments are made. There is very little falling off in the demand, and it is not thought there will be any let up until after the Christmas holidays. No. 27 One Pass Cold Rolled Soft Steel Sheets are quoted by jobbers at 4.15c. to 4.20c., and Galvanized Sheets at 65 per cent. off the list. An advance has been made in the price of genuine Russia Iron, owing to supplies of this metal having been considerably depleted during the prolonged scarcity of American Planished Iron. Russia Iron is now quoted at 11c. to 13c. per lb.

Chicago advices are as follows: The supply is growing a little better, but it is not yet large enough to fully satisfy the trade. Stove Pipe sizes of Black Sheets are in very urgent demand, and on these sizes jobbers are still asking 4c. Other sizes of No. 27 Black Sheets are easier, and can now be had at 3.75c. to 3.80c. Galvanized Sheets are a little more plentiful, and small lots from stock are selling at 65 and 5. Great scarcity continues in Bright Tin Plates, and high prices still rule for spot Plates. The stocks of Terne Plates are getting a little larger, and the trade is consequently being better supplied.

Old Metals.—The market for Old Metals is rather more active; prices are unchanged. Dealers are paying about the following prices for moderate sized lots, delivered at New York or corresponding points:

Heavy Copper.....	per lb. 14¾c.
Light and Tinned Copper.....	per lb. 12¾c.
Heavy Brass.....	per lb. 9¼c.
Light Brass.....	per lb. 7½c.
Lead.....	per lb. 4 c.
Tea Lead.....	per lb. 3½c.
Zinc.....	per lb. 2¾c.
No. 1 Pewter.....	per lb. 17½c.
No. 2 Pewter.....	per lb. 8½c.

Tin Plate Scrap, per gross ton.....	\$6.50 to \$7.00
Wrought Iron Scrap, per gross ton.....	10.50 to 11.00
Heavy Cast Scrap, per gross ton.....	10.25 to 10.50
Stove Plate Scrap, per gross ton.....	7.25 to 7.50
Burnt Iron, per gross ton.....	5.00 to 5.50

THE PIG IRON MARKET.

NEW YORK.—There has been a moderate amount of buying for delivery during the balance of the year. One large contract, under negotiation for a considerable period, has not yet been closed. We quote: Lehigh, Schuylkill and Virginia Irons, No. 1, \$16 to \$17.50; No. 2 X, \$14.75 to \$15.75; No. 2 Plain, \$14 to \$14.50; Tennessee and Alabama brands, No. 1 Foundry, \$15 to \$15.50; No. 2 Foundry, \$14.75 to \$15; No. 1 Soft, \$14.75 to \$15; No. 2 Soft, \$14.50 to \$14.75; No. 3 Foundry, \$13.75 to \$14; No. 4 Foundry, \$13.50 to \$13.75.

CHICAGO.—The slight lull noted in last week's report proved to be simply the prelude to a spurt of decided activity. The transactions during the week have been on a large scale, it being estimated that from 25,000 to 30,000 tons were placed under contract. The business thus placed was well distributed among Northern and Southern brands. A strong demand continues for Spot Iron, which is quite scarce. We quote as follows:

Lake Superior Charcoal.....	\$17.00 to \$18.00
Local Coke Foundry, No. 1.....	15.25 to 16.00
Local Coke Foundry, No. 2.....	14.75 to 15.25
Local Coke Foundry, No. 3.....	14.25 to 14.75
Local Scotch, No. 1.....	15.25 to 16.00
Ohio Strong Softeners, No. 1.....	17.00 to 17.50
Southern Silvery, according to Silicon.	15.65 to 16.00
Southern Coke, No. 1.....	15.15 to 15.40
Southern Coke, No. 2.....	14.40 to 14.65
Southern Coke, No. 3.....	13.90 to 14.15
Southern Coke, No. 1 Soft.....	15.15 to 15.40
Southern Coke, No. 2 Soft.....	14.40 to 14.65

PHILADELPHIA.—The demand has been of a very satisfactory character, and sellers have no difficulty in securing quite a full line of business at prices within the range quoted in our recent report. Stocks of Iron both in first and second hands are at a low point, consequently deliveries are called for with great urgency. This, of course, imparts a strong feeling to sellers, as with everything sold close up there is no necessity for running after new business. The average sales during the past week may, perhaps, have been a trifle higher than last week, but the range remains as follows for Philadelphia and nearby points, and 25c. to 50c. lower for deliveries within a radius of 100 miles, south or west: No. 1 X Foundry, \$15.50 to \$16; No. 2 X Foundry, \$15 to \$15.50; No. 2 Plain, \$14.50 to \$14.75.

PITTSBURGH.—The whole Pig Iron market is very strong and there is a scarcity of Iron for prompt shipment. The output of the Bessemer furnaces is pretty well taken care of for the balance of the year. Foundry Iron is very firm, and some of the Valley furnaces report sales of No. 2 at \$14.50, at furnace, equal to \$15.25, Pittsburgh. We quote Standard Bessemer Iron at \$16; No. 1 Foundry, \$15 to \$15.50; No. 2, \$14.50 to \$15, and No. 3, \$14 to \$14.50, all f.o.b. Pittsburgh.

CINCINNATI.—The situation in the Pig Iron market is as good as could be asked for. There has been a very good run of orders, mainly of medium size, and almost altogether for delivery in the first half of next year. The outlook is for a good steady market for some time to come. We quote f.o.b. Cincinnati:

Southern Coke, No. 1.....	to \$14.25
Southern Coke, No. 2.....	to 13.75
Southern Coke, No. 3.....	to 13.25
Southern Coke, No. 4.....	to 12.75
Southern Coke, No. 1 Soft.....	to 14.25
Southern Coke, No. 2 Soft.....	to 13.75
Southern Coke, Gray Forge.....	to 12.75
Southern Coke, Mottled.....	to 12.75
Ohio Silvery, No. 1.....	\$15.10 to 15.60
Ohio Silvery, No. 2.....	14.60 to 15.10
Lake Superior Coke, No. 1.....	15.10 to 15.60
Lake Superior Coke, No. 2.....	14.60 to 15.35
Lake Superior Coke, No. 3.....	14.10 to 14.85

ST. LOUIS.—The requirements in the Pig Iron market continue very heavy, with no sign of lessening in the demand. Orders for delivery during the first three months of 1902 are very numerous, and a number are noted covering the first six months of the new year. It is reported that some difficulty is being experienced on account of a shortage of cars for transporting the Iron from the furnaces. We quote as follows for cash, f.o.b. St. Louis:

Southern, No. 1 Foundry.....	\$14.75 to \$15.00
Southern, No. 2 Foundry.....	14.00 to 14.25

Southern, No. 3 Foundry.....	13.50 to 13.75
Southern, No. 4 Foundry.....	13.00 to 13.25
No. 1 Soft.....	14.50 to 14.75
No. 2 Soft.....	14.00 to 14.50

CHICAGO REPORT.

Scrap Iron and Steel.—The demand is falling off and lower prices have to be taken to effect sales. Dealers quote the following buying prices, in carload lots, Chicago delivery:

	Per net ton.
Country Wrought Scrap.....	\$11.00 to \$12.00
Machinery Cast.....	10.50 to 11.00
Malleable Cast.....	10.00 to 11.00
Stove Plate (free from burnt).....	to 8.00
Burnt Iron and Grate Bars.....	5.50 to 6.00
Sheet Iron and Hoops.....	6.00 to 7.00
Plow Steel.....	to 10.00
Breaking Stock.....	9.00 to 10.00
No. 2, such as Shovels, Hoes, &c.....	to 7.00
Old Boilers—whole (Iron).....	6.00 to 7.00
Old Boilers (Iron) cut in single Sheets and Rings.....	9.50 to 10.00
Old Gas Pipe and Boiler Tubes.....	11.00 to 11.50
Cast Borings.....	4.50 to 5.00
Turnings.....	9.50 to 10.00
Horseshoes.....	to 13.00

Old Metals.—Some improvement is observed in the movement of Metals, especially Copper and Brass. Dealers quote buying prices on small lots as follows:

	Per lb.
Copper Wire and Heavy.....	14½c.
Copper Bottoms.....	13 c.
Copper Clips.....	14 c.
Red Brass.....	13½c.
Yellow Brass.....	9½c.
Red Brass Borings.....	11½c.
Yellow Brass Borings.....	8½c.
Light Brass.....	7½c.
Pipe Lead.....	4 c.
Tea Lead.....	3½c.
Zinc.....	2.80c.
Tin Foil.....	20 c.
Pewter, No. 1.....	17 c.
Pewter, No. 2.....	14 c.

Old Rubber.—Only a moderate demand is reported. An error was made last week in the quotation on Shoes. Dealers' buying prices are as follows:

	Per net ton.	Per lb.
Garden Hose.....	\$25.00
Air Brake Hose.....	46.00
Rubber Shoes.....	7¾c.
Rubber Car Springs.....	5½c.
Inside Bicycle Tubing.....	22 c.
Outside Tubing.....	7¼c.
Black Rubber.....	4¼c.
White Rubber.....	8½c.

Rags.—Buying price of good country Mixed Rags, Chicago delivery, is 75c. to 85c. per 100 lbs., in any quantities.

Anthracite Coal.—The trade is hampered by the great shortage of cars at the mines. The demand is heavy. The schedule for carload lots is as follows:

	Grate.	Egg and Stove.
Chicago.....	\$5.75	\$6.00
Milwaukee, Wis.....	5.75	6.00
St. Louis.....	6.20	6.45
Kansas City, Mo.....	8.25	8.50

WHEN the management of the Pan-American Exposition at Buffalo decided to adopt the Frink Reflectors for lighting the railway station and Transportation Building, they were doubtless thoroughly familiar with the sterling qualities of these Reflectors, which have radiated light in all parts of the world for nearly half a century, so that the award of a silver medal would seem to be a just recognition of their many valuable points of advantage and superiority in lighting capacity, durability and appearance. We are advised that these Reflectors have been awarded a medal in every exhibition in which they have been entered, and as they are made in every conceivable shape, size and style for every possible purpose, a catalogue of their numerous products is well worth having. A card addressed to I. P. Frink, 551 Pearl street, New York, will bring a ready response to any inquiry along the line of light.

THE JOSEPH DIXON CRUCIBLE COMPANY, Jersey City, N. J., manufacturers of Dixon's Silica-Graphite Paint, are sending through the mails a card upon which is printed a letter from one of the most prominent bridge makers of the United States, bearing testimony to the excellent results obtained by him in the use of this Paint, which he considers the best kind of metal preservative.

THE HARDWARE TRADE.

The demand upon the manufacturers has apparently increased within a week or two. Orders are for the most part to fill up gaps in the stock and thus complete assortments. With the difficulty in obtaining raw material there are a good many lines which are in short supply and many hurry orders are being received by the makers. While on some lines manufacturers are keeping up with the demand, on others and perhaps an increasing number they are considerably behind, causing more or less inconvenience to the trade. The tone of the market is decidedly firm with the exception of a few lines, which, owing to special circumstances, are more or less under suspicion. The trade is certainly feeling the effect of reaction from high combination prices in certain lines, with a probability that more changes of this character are to be looked for.

The tone of the iron market is a source of strength to iron products generally and no important early change in prices is apparently anticipated by the trade, who are conducting their business vigorously on the theory that present satisfactory conditions are likely to continue at least until the end of the year, and that even after that date there is no reason to apprehend any disturbance of the existing prosperity. There is, however, no disposition to buy beyond requirements in view of the fact that prices are more likely to be lower than higher next year. The reports from merchants, both wholesale and retail, continue satisfactory, indicating that an excellent business is doing. Stocks in the hands of both classes are for the most part fairly large and well assorted, but reflect the difficulty above referred to in obtaining some kinds of goods.

NOTES ON PRICES.

Steel Enameled Bathtubs.—Following the lead taken by the other makers of this line of goods, Seestedt Bros. Mfg. Company, Romulus, Mich., have withdrawn all prices on their All Steel Enameled Bathtubs Nos. 20, 21, 22 and 23. This firm have also withdrawn prices on their line of Closet Seats. The local market for Steel Enameled Bathtubs has undergone no change since the prices were marked down 5 per cent. two weeks ago. It looks as though prices will remain stationary for the next month or two.

Steel Sinks.—The Kilbourne & Jacobs Mfg. Company, Columbus, Ohio, under date of October 22, withdrew all quotations on Sinks, Sink Backs and Brackets. New prices will be furnished on application to the home office.

Refrigerators.—The manufacturers of Refrigerators have advanced prices 5 per cent. While there is no association of Refrigerator manufacturers or any arrangement whereby a uniformity of price can be enforced, they have agreed upon the present advance, which is considered desirable as enabling the makers to turn out better goods, and at the same time steady the market. Orders for Refrigerators are said to be coming in very freely and the prospects are favorable for a large business during the coming season.

Tacks.—The Tack market within the past few weeks has shown some improvement and prices are perceptibly and in some cases quotably higher. There is apparently a better understanding between the manufacturers than has heretofore prevailed, and some of them have been withdrawing quotations and announcing higher prices. The difficulty which is experienced in obtaining the raw material tends to strengthen the market. The volume of business, too, is very satisfactory, and in several lines manufacturers have difficulty in supplying the trade as promptly as desired.

Steel Goods.—There is a good deal of unevenness in the market on Steel Goods, as there is no agreement between the manufacturers, and active competition has developed. The result is that materially lower prices are current, and it is evident that next season the trade will be purchasing this line of goods at material concessions from prices which ruled last season. Orders are

being placed by the large buyers quite freely, but in most cases we are advised that it is under a guarantee.

Set and Cap Screws.—A reduction of about 10 per cent. has recently been made by the manufacturers of Set and Cap Screws. The market is referred to as well maintained at the new price.

Poultry Netting.—A slight advance has been made by the manufacturers of Galvanized Poultry Netting, and their quotation on this line to the general trade is discount 80 and 20 per cent.

Wire Cloth.—Buyers for next season are giving their attention to the market on Wire Cloth, negotiating with the manufacturers on the subject. It is as yet rather early for the making of prices on this line, and the developments of the next few weeks will be awaited with interest.

Wire Nails.—There continues to be a steady movement in Nails, and the volume of business is very satisfactory. It is, in fact, so large that most of the mills are kept fully occupied on orders, having little opportunity to accumulate stock. This is the case notwithstanding the fact that the trade as a rule are buying only to supply their present wants, not caring to stock up at present prices and take a chance of a decline. The market is feeling the effect of the efforts made by new concerns to secure business, who are making slight concessions of 5 to 10 cents on regular announced prices, both to the jobbing trade and to the larger retailers. This cutting gives some irregularity to the market. The irregularity in the price of Wire Nails from the mills has not affected the New York market, however, small lots from store being sold at \$2.60 per keg.

Cut Nails.—The demand for Cut Nails in the New York market keeps up to the usual proportions. Some merchants object to the Iron Cut Nails which are occasionally offered as a substitute for Steel Nails, on account of the scarcity of the latter. Cut Nails from store are quoted at \$2.18 to \$2.30 per keg.

Wire.—The demand for Plain Wire continues good, but not quite as heavy as some time ago. The season's trade has been very satisfactory to the manufacturers, the demand being very heavy and prices well sustained until recently. Plain Wire is retailed in New York at 2.60 cents and Galvanized at 3 cents.

Window Glass.—The demand for Window Glass is reported to be on the increase and jobbers' prices are being well maintained.

White Lead.—Favorable weather conditions have kept the demand for White Lead in Oil up to good proportions. Regular quotations remain unchanged, although there are reports of more or less irregularity in prices in some sections. White Lead in Oil is quoted in a retail way at 7 to 7¼ cents per pound.

Linseed Oil.—Crushers are slow in making deliveries of Linseed Oil contracted for October. The supply for prompt delivery is light, and these conditions are not expected to better themselves before the end of the month. City Raw Oil is quoted in moderate sized lots at 66 to 67 cents per gallon. Boiled Oil is 2 cents advance on Raw.

Spirits Turpentine.—Business in Turpentine is confined to small lots in this market, and the supply on hand is not large, but sufficient for present requirements. Retail quotations are 39 to 39½ cents per gallon.

TRADE NOTES.

THE INTERNATIONAL ALUMINUM MINING COMPANY of Pittsburgh, Pa., have been chartered by Mathieu Souvielle, Frank C. Harper and Frank N. McKelvy to mine bauxite.

THE new foundry and machine shops of the Lewis Foundry & Machine Company, under erection for some time at Cornopolis, Pa., on the line of the Pittsburgh & Lake Erie Railroad, and about 10 miles from Pittsburgh, are nearly completed. The concern expect to occupy these new shops in a short time, and will then abandon their present plant on the South Side, which has become too small to accommodate their increasing business in

the mannfacture of Rolls and Rolling Mill Machinery of all kinds.

On the 17th inst. the stockholders of the American Brass Company voted to issue \$2,000,000 of stoek which was already created but had not been previously issued. Of this, \$1,425,000 will be for new properties. We are officially advised that the American Brass Company have purchased all of the capital stock and have assumed control of the Holmes, Booth & Haydens Company of Waterbnry, Conn. We are also advised that the Coe Brass & Mfg. Company of Torrington, Conn., who are an arm of the American Brass Company, have acquired the Chicago Brass Company. Owing to provisions in the charter of the American Brass Company, they cannot acquire properties outside of the State of Connecticut.

A Handy Drill Rack.

It is very usual to find a narrow strip of tin or leather tacked in loops on the wall of a shop to serve as a tool rack. A rack of this kind is easy to make, and is of considerable value as snpplying a place where tools can be kept. An improvement over the common form of tin rack is shown in the illnstration. It will be noticed that

A Handy Drill Rack.

in the center of each loop is an extension piece, which is bent under the loop and fastened to the wall, making a bottom to the socket.

This device is so simple that it might well be used in many shops as a means of promoting order. The rack shown is used for drills, which are arranged according to size, the smallest being placed at the left and the largest at right. The same scheme can be used with other tools to good advantage.

Attorney-General Sheets of Ohio has decided that the United States Steel Corporation are amenable to the Ohio law which taxes foreign corporations doing business in that State. He has investigated the matter and finds that the Steel Corporation own the majority of the stock of several constitnent companies, but do not own any of the plants in Ohio, and therefore are not subject directly to the tax. The constituent companies of the United States Steel Corporation, however, are liable to the tax, and will be forced to pay it.

In the United States District Conrnt at Buffalo, N. Y., on October 22, Judge Hazel handed down a decision for the defendants in an action by the Electric Smelting & Aluminm Company of Cleveland, Ohio, against the Pittsburgh Rednction Company of Niagara Falls, N. Y., for alleged infringement of a patent for cheaply separating aluminum by an electric process. Judge Hazel decided that no infringement of the patents of the plaintiffs had been made by the defendants. This decision is of great importance, as it confirms the Pittsburgh Reduction Company in their virtual monopoly of the manufacture of aluminum in the United States.

WARREN G. PARSONS, John and Church streets, Hoosick Falls, N. Y., who has dealt in House Furnishing Goods, Hardware, Stoves and Ranges for the past

30 years, announces that he is carrying a complete stock of everything required in these lines, with every facility for rendering his customers prompt and efficient service.

M. J. KELLY has entered the retail Stove and Fnrnace business at 51 Bridge street, Ansonia, Conn.

Sheet Metal Pattern Drafting

A course of instruction by mail for tinsmiths, coppermiths, plumbers, sheet-iron workers, furnace workers, skylight makers and others that will enable a student to "strike out" working patterns for all kinds of sheet metal work. This is what a student says:

His Course More Than Paid for Itself

I am a tinsmith, and consider your course in Sheet Metal Pattern Drafting one of the best investments I ever made. Before I was half through I had realized from it more than the money paid for the whole course.

M. E. TOBIAS, 62
63 Fifteenth St.,
Wheeling, W. Va.

We teach by mail Mechanical, Steam, Electrical, Civil and Mining Engineering; Shop and Foundry Practice; Mechanical Drawing; Architecture; Plumbing; Sheet Metal Work; Telephony; Telegraphy; Chemistry; Ornamental Design; Lettering; Book-keeping; Stenography; Teaching; English Branches; Locomotive Running; Electrotherapeutics. When writing state subject in which interested.

taught by mail.

TINSMITHS' HELPER *and* PATTERN BOOK

WITH USEFUL RULES, DIAGRAMS and TABLES
= By H. K. Vosburgh =
NEW AND IMPROVED EDITION

A USEFUL hand-book for tinner and other mechanics, treating simple problems in pattern cutting, such as are of daily occurrence in the shop. An elementary manual for the young tinsmiths. A handy reference for all sheet metal workers.

120 Pages
53 Figures

An Invaluable \$1.00
Pocket Companion . .

Section 1 ~ Pages 1-66 Diagrams and Patterns

Demonstrates in a simple way, and by means of illustrations and descriptive text, about 50 examples of sheet metal pattern work, such as the method of cutting can breasts, flared tinware, scale scoops, oval boiler covers, lips for measures, elbow patterns, &c.

Section 2 ~ Pages 69-88 Epitome of Mensuration

Compiled with regard to the requirements of the tinner, describing how to find the area of a circle, the circumference of a circle, the contents of a sphere, a cylinder, a cone, and other information relating to the work of a tinsmith.

Section 3 ~ Pages 89-120 Tables, Rules, Recipes

Gives tables of the weights of sheet metals, including the weight of black sheet iron, sheet lead, and galvanized iron sheets with their dimensions; the weight of lead pipe per foot; the weights of tin plates, sheet copper and sheet zinc. Several pages are devoted to tables giving the areas and circumferences of circles, the capacity of cans, the number of barrels in cisterns and tanks, sizes of tinware in form of frustum of a cone, &c., and practical receipts, including mixtures for solders of different kinds, soldering fluxes, and various cements.

Cloth Bound, \$1.00 Postpaid

PROVIDENCE, R. I.

A UNIVERSAL REMEDY FOR LEAKY ROOFS.

The valuable qualities of a good roofing cement are firm adhesiveness and elasticity. These qualities the American Seal Builders' and Roofers' Elastic Oil Cement possesses. It will adhere firmly to Slate or Metal and will not crack or crumble. It is especially recommended for repairing leaks around chimneys, dormer windows, skylights, scuttles, firewalls and any place that requires fixing on a roof, either Slate, Tin or Shingle.

This Cement will answer to repair a roof when Solder cannot be used.

PUT UP In Barrels, about 800 lbs. In Tubs, about 112 lbs. In 25 and 50 lb. Pails. In 5, 10 and 15 lb. Pails.

Galvanizing and Tinning.

▲ Practical Treatise on Coating with Tin and Zinc, with a Special Chapter on Tinning Gray Iron Castings. By W. T. Flanders. Size 5½ x 8 inches. 98 pages, 40 illustrations. Cloth bound. Price \$2.00.

The author of this work has made a specialty of galvanizing and tinning, and has been employed to erect plants in various parts of the country, also to instruct the owners, so that, in all instances, they have been able to operate them successfully. The subject of galvanizing is, therefore, treated from the standpoint of an expert and in a practical manner. The selection of materials and apparatus for erecting plants of large and small capacity is treated, together with instructions for their equipment and accompanied by many illustrations of the plants and of the tools and appliances. Plain directions are given for the preparatory treatment of metals and articles to be coated, and every detail which is of importance in successfully applying to metals a secure and attractive coating is described. The tinning of articles is treated in the same practical manner. The difficulties found by many who have attempted to tin malleable and gray iron castings are explained and methods for doing the work made simple.

CONTENTS.

Galvanizing.

Locating a Plant and Selecting a Kettle.
The Galvanizing Room.
Tanks for Acids and Other Purposes.
Tools for Galvanizing.
Filling and Firing a New Kettle.
The Use of a Pyrometer.
Materials Used in Galvanizing.

ART IN METAL CEILINGS

In the past the objection was raised that Metal Ceilings were not artistic. That objection no longer holds good,—

have completely done away with it.

You can have Metal Ceilings that are thoroughly artistic and strictly in harmony—from top to bottom—all over—throughout—if you select and order **BERGER'S CLASSIC**.

Berger's Classic Metal Ceilings are made in eleven complete and distinct artistic styles—Greek; Roman and Romanesque; Gothic and Moorish; German, French and Italian Renaissance; Rococo; Empire and Colonial—each provided with a variety of patterns to meet the requirements of different rooms.

If you have not seen our Classic Designs it is more than likely you do not realize how effective they are.

Write for Catalogue No. 5 and judge for yourself of their beauty.

Give us a chance to figure on your requirements.

J. L. PERKINS & CO., Western Agents, 241 Lake St., Chicago.

The New Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting
as applied to all branches
of sheet metal work.

Cloth Bound, Price \$5.

This work contains a collection of 218 problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added 75 new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

- I. Terms and Definitions—15 pages.
- II. Drawing Instruments and Materials—13 pages.
- III. Linear Drawing—6 pages.
- IV. Geometrical Problems—35 pages.
- V. PRINCIPLES OF PATTERN CUTTING—25 pages.
- VI. PATTERN PROBLEMS (3 Sections)—325 pages.
 1. MITER CUTTING,
 2. FLARING WORK,
 3. TRIANGULATION.

All Tanners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

The New Metal Worker Pattern Book.

Price \$5, post or expressage paid.

THE DOUBLE TRUSS CORNICE BRAKE.

This is the most practical brake on the market.

It is the most practical because, in the first place, it is lower in price than any other Cornice brake that will do perfect work.

Secondly, because its practical construction enables you to use it to the most profitable advantage.

When you hear about a good thing in your line of business, investigate it. Turn on it the light of reason and consider its money-making possibilities.

Let us send you information regarding our double edge on front leaf, for making finemembers and corrugations.

HERCULES SHEARS

make the cutting of sheet metal of heavy gauges an easy task for the mechanic and a profitable operation for the employer. With them a man can cut No. 12 steel with one hand on the lever, leaving the other hand free to guide the stock while cutting elbows,

ties and circles, as small as 8 in h radius; this is done without burring or buckling either piece, thus avoiding hammering and straightening, which add to the cost of the product. They split sheets of any width or length up to No 12 gauge, cut wire or bar-steel $\frac{1}{8}$ inch thick, cut off and mitre angle iron $\frac{1}{8}$ inch thick, and do it perfectly.

PRICE, - - \$35.00.

Concise and Practical Explanations for Plumbers, Tinnners and Hardware

Dealers on How to Wire Buildings for Bells, Alarms, Annunciators, and for Gas Lighting from Batteries.

Illustrated with Twenty-two Diagrams.

BY **WILLIAM A. WITTBECKER.**

Price, in Paper, 25 Cents. Price, in Cloth, 50 Cents.

The growing demand for simple electrical apparatus in dwelling houses, offices and workshops, and the need of plain instructions whereby any person without a previous knowledge of electricity may be enabled to undertake their successful installation, has prompted the publication of this little book. It is not intended for the amateur who seeks for nothing but experimental work, neither is it expected to enlighten the expert electrician; but to the person who is seeking for information that will assist him in increasing his daily earnings this little volume is addressed.

A 62-PAGE PAMPHLET

Comprising a Series of
Articles and Letters on
*Chimney Troubles
and Their Remedies*
published under the title

Contains a compilation from the col-
umns of THE METAL WORKER, of arti-
cles and correspondence relating to
house chimneys, defective flues, and
kindred topics, comprising a source of
information of the most practical and
reliable nature, on overcoming difficul-
ties which occur in the working of
chimneys, flues, etc.

To all who are interested in flues
and drafts, in their relation to
stoves, furnaces and house heating ap-
paratus, this book will prove instruc-
tive and helpful.

The Contents are as follows

	Page.
POINTS ON CHIMNEYS	7-32
An illustrated article by J. L. Bixby, Jr., describing many details in chimneys, which cause trouble, and giving remedies. An important table is presented, of the sizes of chimneys required in dwelling houses, based upon the amount of work to be done.	
DEFECTIVE FLUES	33-35
This article presents information resulting from a wide, practical experience of the writer, and gives sound advice on some of the details of chimney construction.	
HOW TO IMPROVE A WEAK CHIMNEY	36-40
VARIOUS FORMS OF VENTILATORS or CHIMNEY TOPS	41-45
CONDENSATION IN STOVE PIPES	46, 47
SMOKE PIPE FOR WOOD FURNACES	48
REMEDYING DOWN DRAFT IN CHIMNEY	49-51
CONNECTED FLUES DESTROY DRAFT	52-55
FAILS TO BAKE ON BOTTOM	56-62

40 good Illustrations help
to make the Text clear.

SPRAGUE

Damper and Valve Regulator.

—A—

CONVERSATION.

Coal Dealer.—“Hello, Mr. Man, how is it you ordered only six tons of coal this fall? You have always had twelve before.”

Mr. Man.—“Well, you see, we used

The Sprague Regulator

last winter and had three tons left over, and now need only six more to carry us through. That will give us an even, healthful heat.”

“It’s a Great Fuel Saver.”

Order one for “that heater” which is not just right. We will gamble that it is not being properly regulated. Give your customer 30 days’ trial. We will stand by you.

THE Mogul Furnace

Diameter of fire pot.	19 1/4 inches.
Height to top of elbow	56 "
Height to bottom of pipe collar	46 "
Diameter of ring where casing fits	31 1/2 "
Weight	800 pounds.

It is made with regular furnace joints for cement from the bottom up; also provided with draw center anti-clinker grate, which can be taken out and replaced through the ash pit. The fire pot has fingers at the bottom on the inside to assist in grinding up the cinder and cleaning the fire. A heavy cast iron elbow and cast ring for casing and one cast iron water pan is sent with each furnace. The "Mogul" is cheaper to operate than a hard coal base burner and will heat the house. It is plain, heavy and will do the work of, and outlast many of the furnaces on the market costing twice the money. Get our prices.

HARD HOUSES TO HEAT.

When you have out-of-the-ordinary houses that look like they'll be difficult to heat, advise the use of the

MAGEE BOSTON HEATER

Warm Air and Hot Water in Combination. You may depend upon its doing the work. Use it in large houses, particularly with large glass exposure, or with out-of-the-way rooms that may be difficult to reach with warm air. Heat principal rooms with air; those remote from heater or specially exposed, with water. You'll solve the problems of heating under severe wind-pressure and through long or crooked pipes. You'll secure thorough ventilation and a greater saving in fuel than by any other system of indirect heating.

54 Dearborn Street, CHICAGO, ILL.

Burn Hard or Soft Coal, or Coke. Large Doors.

Some Ripe Experience

Has come to us through watching the doings of dealers throughout the United States.

We find that the dealer who sells cheap furnaces not only loses ground in the furnace business but also has a falling off in his other lines.

On the other hand we can say that the man who sells a good furnace and charges enough to do a good job will, in a few years, be the leading furnace man in his town and at the same time build up his other business.

The *American Furnace* is made for the better class of trade; is durable, clean and economical in fuel.

CONNECTIONS.

A SELECTION OF

Practical Letters and Articles
Relating to Water Backs and
Range Boilers.

FIFTH ENLARGED EDITION.

104 Pages, 113 Illustrations, 6 x 9 in.
Cloth Bound.

Price, \$1.00, Postpaid.

Press Notices of First Edition :

The book is a practical helper to every member of the plumbing trade, who, being alive to his own interests, should embrace this opportunity to obtain the valuable instruction in which the work abounds.—*New England Stove, Hardware and House Furnisher.*

The Metal Worker produces in this volume a number of queries, with answers thereto, which have appeared in that paper. It will be seen that any plumber who is troubled to make boilers work satisfactorily will here find his troubles alleviated. It contains numerous illustrations and throughout is highly practical from the standpoint of the plumber. It contains a table of contents and an index.—*Scientific American.*

Both interesting and instructive to our trade. It shows how mistakes are apt to arise and how they may be overcome.—*Plumbers' Trade Journal.*

The publisher of this work is well known for his former successful efforts in the publication of useful and thoroughly practical books for metal workers and steam fitters. The book before us is a model of its kind in judicious compilation, practical instruction, neat illustrations and general typographical appearance.—*The Master Steam Fitter.*

The book is well got up and the information well given. Those interested in works of this character will do well in buying it.—*The Plumber and Decorator.*

Can be considered an authority on the subject to which it relates.—*American Engineering.*

Nearly every problem is illustrated fully and this interesting question of water back connections will be found to be quite fully treated in the volume.—*Domestic Engineering.*

Sent, prepaid, on receipt of price by

DAVID WILLIAMS CO., Publishers,
232-238 William Street, New York.

A Tea-Kettle Boils Quicker on my Chimney than on my Stove.

A fire in a red glow represents 1200 degrees of heat, a draft through this carries the heat out of the chimney unless intercepted by a cross tube **Rochester Radiator**, when nearly all this waste heat is conveyed into the room by the rapid circulation of air through the tubes and saved. This appeals to common sense and is verified by the most thorough scientific test.

The **Rochester Radiator** is a satisfactory article to sell and one that affords the dealer a good profit.

ABOUT ESTIMATE BOOKS

For Plumbers and
Heating Men

Your Contract and Estimate Record Book for Plumbers is one of the best books that ever came into our house and we would not be without it for three times the amount it cost. We can figure without omitting anything with accuracy at a very short time. We think that every plumber should not be without this valuable book.

W. C. BENNETT & CO., Haverhill, Mass.

We have used an estimate book for three years and could not do without one. Would say that yours is far superior to any yet used and can cheerfully recommend it.

W. R. PARK & SON, Taunton, Mass.

A great advantage. Prevents the leaving out of small items, which amount to more than the cost of the book in a very short time.

CHAS. W. COOMBS, Lawrence, Mass.

Your Contract and Estimate Record Book has been of great use to me in both the saving of money and labor, and I would highly recommend it to any or all master plumbers.

THOMAS P. DOHERTY, Taunton, Mass.

These testimonials are a few of many, and indicate both that a well arranged estimate book, which provides complete lists of items to be figured upon, is a time, labor and money saver, and that the "CONTRACT AND ESTIMATE RECORD BOOKS" come up to this requirement.

THE EDITIONS ARE AS FOLLOWS:

CONTRACT AND ESTIMATE RECORD BOOK FOR PLUMBERS

OFFICE EDITION.

200 Pages. Arranged for 100 Estimates.
Size 8 x 11 inches. Cloth bound, \$1.50
500 Pages. Arranged for 250 Estimates.
Size 8 x 11 inches. Cloth bound, \$2.50

POCKET EDITION.

200 Pages. Arranged for 50 Estimates.
Size 3½ x 8 in. (oblong). Flexible cloth
binding, \$0.50

CONTRACT AND ESTIMATE RECORD BOOK FOR STEAM AND HOT WATER HEATING

200 Pages. Arranged for 100 Estimates.
7 x 12 inches. Cloth bound, \$1.50

NOTE. The omission of one item in an estimate on a plumbing or heating job might result in the loss of all profit. These books provide a reliable, accurate, business-like record, and a sure means of avoiding loss due to mistakes and omissions.

Sent prepaid on receipt of price.

The Roofing, Cornice

And Skylight Manual

175 Pages, 170 Illustrations, 13 Plates

THE ROOFING, CORNICE AND SKYLIGHT MANUAL is an important addition to our increasing line of practical books for Sheet Metal Workers. It is a substantial volume, well printed and bound, and freely illustrated with engravings, accurately showing the various phases of work in progress.

The three subjects of Tin Roofing, Cornice Shop Practice, and Skylight Construction are discussed in a thorough and practical manner, the work being designed as a shop companion or reference for sheet metal workers, as well as a guide to young mechanics who are intending to follow any or all of these branches of work.

Tin Roofing Pages 1-50. This section presents an article prepared specially for the book by an expert mechanic. A few of the subjects treated are the laying of flat and standing seam roofing, described in detail, with instructions for flashing around chimneys; connecting roofs with wall flashing; covering parapet walls and bulkheads; putting in valleys; shingle flashing, &c. An important table is given for finding the quantity of tin required for roofs.

Cornice Making Pages 51-140. This part of the volume consists of an article entitled "The Country Cornice Shop," reprinted from *The Metal Worker*, and treating the subject at length. It embraces a description of a shop equipment, such as can be purchased or made, and adapted to the country shop. A few of the subjects treated are the method of developing the patterns for much of the simpler work, as well as for cutting cornice miters; attaching molded gutters to brick walls; the attachment of eave trough to roofs of different kinds; the manufacture of round and square leaders; the making of simpler ornaments, etc.

Skylight Construction Pages 143-175. This division of the work consists of two prize essays reprinted from *The Metal Worker*, giving instructions for the production of skylights of all sizes, the development of hip bar and miters, also curb and side bars. One of these articles describes a skylight without a ventilator, and the other a skylight with a ventilator in the top. The illustrations cover various phases of the work fully and also show the method of catching the condensation which occurs with all skylights.

Heating Mains.

The convenience experienced by those who are served from the heating mains which have been run through the streets of different cities has been such that, even if some disadvantages have been experienced, their use is not likely to be discontinued. In fact, it may be said that the heating of buildings by steam or hot water supplied from street mains has only just begun, and that the newer systems to be laid will be equipped to overcome the difficulties about which complaints heretofore have arisen. From many cities the report comes that old heating mains now leak to such an extent that their operation is no longer profitable and, further, that these leaks cause a damage to the roadway. In some localities the authorities have begun action to compel the companies operating such lines to put them in repair; in others, where contracts have not been completed, the companies are demanded to take such steps as may be necessary to fulfill their contracts.

There has been more trouble attending the use of steam heating mains than hot water heating mains. This is due to the higher temperature carried in the steam heating mains, owing to the pressure needed to distribute the steam through the systems. With the high temperature comes a greater expansion of the pipes and a certain movement of them. This, in some instances, has been sufficient to break the fittings or cause rupture of the pipes, allowing the steam to escape and find its way to the surface of the ground. This, in winter weather, with the continual freezing and thawing, has caused holes to be worn, endangering the usual street traffic. In other cases the line may not have been buried sufficiently below the ground, and in consequence, during cold weather, the snow has melted or the frost has thawed so as to leave a portion of the surface in a sloppy condition, which causes it to wear out easily, necessitating the expense of repairs. In many cities, where streets have been newly paved, orders have been given by the city authorities that no openings shall be made in the streets for a period of time, particularly during the fall or winter. This, however, is the very time when the street heating system may need an overhauling for repairs, after having laid in idleness during the summer, and this involves a complication that is not easily disposed of. This all goes to show that where franchises are granted for the laying of heating mains in the streets care should be taken to see whether they be for

steam or hot water, and every precaution should be used to prevent any of the troubles which have been experienced with the systems already in use.

Export Houses and the Cultivation of Foreign Trade.

Formerly there was more or less antagonism on the part of export commission houses to the sending abroad of direct representatives of manufacturers, a spirit which also reflected itself in their opposition to the sending out of such trade literature as catalogues, discount sheets and circulars, as well as to the foreign circulation of trade papers. Something of this spirit remains, but there is coming to be a recognition of the fact that the dissemination of such information, tending to awaken interest in American products, is for the ultimate advantage of houses who make it a business to supply foreign markets. An illustration of this is given in the remarks recently made by the head of one of the largest New York houses having relations with all parts of the world. He not only referred to catalogues, trade papers and printed matter in general as exceedingly useful in cultivating foreign trade, but expressed a fervent wish, as an exporter to the four quarters of the globe, that manufacturers would send their own specially qualified representatives and salesmen to introduce and talk specifically the merits of their goods. The point was made that no individual connected with an export commission house dealing in almost everything in the way of products of manufactures can so intelligently urge the merits of particular goods, meet the objections and answer the foreigners' questions as the manufacturer's salesman, especially qualified by knowledge and experience. It is not necessary for manufacturers to continue such trips unless they prefer to, as when once introduced the well equipped selling organization referred to above, and many others, are competent to market the goods. The main thing is to familiarize the buyer abroad with what he can use that is produced here, and subsequent orders the commission houses can solicit, ship and finance, buying outright from producers here and looking after the numerous intricate details incidental to such trade.

This is a broad way of looking at it from a concern with forty years' experience exporting goods, with millions of capital and numerous connections. The larger the volume of business diverted to the United States by any legitimate means, and the more foreign territory is canvassed by manufacturers or their personal representatives, the better for exporting interests in general. There was a period when the house in question spent much time and effort introducing American merchandise, but their business is now too vast for that, and they acknowledge that producers are better qualified to do it. It may be said that some of the keener manufacturers already realize this and are working along these lines. Some exporters are, however, very chary about giving information on export matters and very much prefer that manufacturers' representatives and their catalogues remain at home.

Furnace Heating Abroad.

In no country is the system of heating houses by means of hot air from especially constructed furnaces so generally used or perfected as in the United States. Although but few foreign countries have adopted this method of heating, Germany has given it considerable attention. A good deal of interest attaches, therefore, to the apparatus described in a special article on the subject presented in this issue. With the same care that all mechanical and scientific problems are worked out in Germany and each detail considered with a special view to economy, the furnaces in general use there have been produced. A marked contrast will be found to exist between the construction of the German furnaces and those in greatest demand in the United States. The furnaces produced in America forty or fifty years ago reflected much the same trend of thought among our early makers as is shown in the German productions. Whenever our pioneer furnace makers could expose a few inches of additional surface in a furnace, with the idea of extracting a greater amount of heat from the products of combustion before they escaped, the surface was added. The best furnaces of the present time are not lacking in heating surface, and they all provide that the fire travel shall be sufficiently long to utilize as far as practicable the heat generated in the fire pot, as well as that which is being carried to the chimney by hot gases. But our modern constructions give little evidence of the careful attempt to increase the surface that is shown in the illustrations of the article referred to. Many of the younger generation of furnacemen have not had an opportunity to study the construction of the first furnaces made here, and they may not recognize in these German furnaces any similarity to some of the earlier furnaces used in the United States. Some of the later American furnaces designed for heating school houses and other large buildings, however, show a trend in the direction indicated by the Germans. Consequently it is probable that all who are interested in furnace heating will find entertainment, and possibly benefit, in reading this special article and studying the illustrations presented with it.

Labor Fully Employed

One of the most reliable tests of prosperity is the condition of the labor market. When labor is fully employed and wages are high it goes without saying that business must be unusually brisk, and that it is being done on a profitable basis. That this condition exists at the present time is patent to the most casual observer. Labor bureaus and industrial agencies generally report that the demand for competent help is largely in excess of the supply. A scarcity of skilled labor is a matter of general complaint among employers in nearly all trades. Especially is this the case with the trades represented by our readers. Calls for tinsmiths, plumbers, steam fitters, stove and furnacemen, cornice makers and sheet metal workers are urgent from all quarters. In some cases shops are actually crippled for lack of competent workmen. Mills and factories generally are running to full capacity, and in some quarters manufacturers find difficulty in securing a sufficiency of hands to enable them to get out their full output of goods to meet the heavy demands of their customers. Present appearances promise a continuance of the prevailing activity in the industrial world throughout the winter, and few mechanics are likely to be out of jobs for some time to come. This is a decidedly gratifying condition of things which promises much for the general well

being and comfort of the community at large. Good wages and steady employment make for contentment and prosperity among the wage earning classes of the country. They also mean a free circulation of money in the purchase of the necessities and comforts of life, thus benefiting all classes of trade down to the smallest storekeeper.

Editorial Notes.

The advocates of public ownership of public utilities have received a shock, and the cause of municipal ownership a probable setback, by the announcement of the lease for a long term of years of the municipal gas plant at Toledo, Ohio, to a private corporation. This plant was erected about ten years ago and has cost the people of Toledo over \$1,000,000 in bonds and \$500,000 more in interest. As a result of a decade's experience it is found that the works have barely paid operating expenses, leaving practically nothing for the payment of interest on the bonds. The latter has been added annually to the deficit, leaving an interest charge of some \$47,000 to be paid yearly by the city on account of the plant. The rental that will be paid by the contracting corporation is only \$6500 a year, leaving a large balance to be defrayed each year by the citizens as the result of this experiment in municipal ownership. That this failure should have happened in the municipality so long under the leadership of "Golden Rule" Jones adds significance to the result.

At this time, when so much building is being done throughout the country, it is worth while drawing attention to one detail of construction that is often overlooked. That is the wiring of houses and other buildings of moderate cost, so that electric lighting may be introduced at any time. The work can be done much more neatly, expeditiously and economically during the construction of building than afterward. Electric lighting systems are being introduced nearly everywhere nowadays and in a short time there will be few places, aside from purely rural localities, unprovided with electrical facilities. The average house of the future will unquestionably be lighted electrically. It is desirable, therefore, that it should be equipped for such illumination from the first. The advantages of electrical illumination over other lighting systems are admitted. It is safer, cleaner and more satisfactory in many ways than either gas or oil. Builders, architects and owners would be acting the part of wisdom in providing for the electric wiring of all houses as they are put up.

American manufacturers are evidently quite as busy in 1901 as they were in 1900. At least this is a reasonable conclusion from an examination of the figures of the Treasury Bureau of Statistics, which show that the total imports of manufacturers' materials in the nine months ending with September, 1901, were greater in value than those of the corresponding months of last year, although an analysis of the imports, article by article, shows that in many cases the prices per unit of quantity have decreased. This decrease in price is so strongly marked that in many cases while the figures of value show a decrease in the nine months of 1901, as compared with those of 1900, the figures of quantity for the same period show an increase. For instance, imports of pig tin, used in manufacturing tin plate, show in value a slight reduction as compared with last year, but in quantity there is an increase of over 2,000,000 pounds. The total value of imports of raw materials for use in manufacturing in the nine months of 1901 was \$221,469,984, as compared with \$217,619,372 in 1900.

WHAT TO DO IN NOVEMBER.

BY H. C. W.

A whole lot of good things for the winter months that you have not done in the years gone by. Make this fall and winter season the best one we have known in our business—we have everything to help us! Make changes that have never been made before, study to have them attractive and different from your neighbors.

There is a wonderful lot of Do and Don't possible for the good of the business in these last months of the year. They should be to us like the home stretch of the race track—in which the urging is done and best results made. More can be done in November and the month that follows to retrieve possibly bad months gone before than in any other three or four ordinary months.

It's a capital time to push and push hard for results. There is a feeling in common among many merchants that "the year is nearly done with, and but little more can be accomplished, do what we will." It's a great mistake if we will only realize it—the best of the race is always at the last.

SOME THINGS TO DO.

Get out what's left of last winter's stock—have it gone over thoroughly—see if it cannot be made as good as the new stock coming in.

Mix it in with this season's goods when ready, and let it get away and bring a profit with the balance, instead of piling it up as "carried over goods," and sacrificing two profits. Hunt up the mistakes of other seasons' buying, and correct them in the winter's purchases for this season.

Some seasons, in spite of all we can do, bring a certain amount of absolutely dead stock; it's a good time to give it away if no other method will move it.

Hunt up the put away cuts of other seasons and get ready for new advertising—and make it new. Decide on what novelty advertising you want to do, whether it be calendars, vest pocket memorandums or what not.

See if show window work cannot be lessened by adding a tile or other permanent floor to the windows, by addition of brackets, drop shelves, wall cases, &c. Have signs and price cards gotten ready in advance, that you may not lose their good when too busy to attend to it.

TRY THE NEW MAN.

new at show window arrangement and new at advertising; see what surprises he has in store for you. He may have been with you for years, and all the time you have missed his good points, doing yourself in detail what he might have done, and to your great advantage. The man in the store who is not given a chance at this work by an employer is diffident as to the asking for it himself—more so than that he is not anxious for it.

An experience of some years has developed the fact that just such a reticent, quiet fellow nearly always shows up for a good window dresser or clever advertiser, if the way be thrown open to him. The writer calls to mind a young German of 18 or 19 years, never suspected for a moment by his employer as having talent for window arrangement, who, after a few weeks, was put in entire charge of such work and has been a prize winner in a number of such contests.

ANOTHER GOOD MAN.

He is in nearly every store, and at this season of the year is extremely valuable. I refer to the young man who, without being constantly reminded of it, will pick out the rusty or soiled pocket knives, razors, scissors and shears, and get them on a basis of "as good as new," bringing their full value. He will take the machinists' tools case and bring back many lost dollars out of it.

He sees that the brass and copper goods are brightened up and made salable, the rusty fire irons brought to a value. He gets the torn and soiled robes and blankets in such shape that at least there is no loss on them.

If he's good at this he's generally good at everything

else in the store. He is worth developing and bringing out, and at this particular season of the year is most valuable to the man who has him on his pay roll.

YOUR WINTER ADVERTISING

is more valuable, perhaps, than that of any other season of the year, and should be made a study. It's a good idea to ask for suggestions from every man at all capable you have in your employ. It's not bad to carry a vest pocket memorandum for jotting down ad ideas as they come to you—else they often get away forever.

Night work is not always desirable, but there is no question that to many of us our brightest squibs and best ideas come to us while sitting at home, and with other details of the business of the day lost sight of. Many men the writer knows do this class of work at night, and at home, because it is best when done there. The reading of the wonderful magazine work gives more and brighter ideas in ad work than we are willing to acknowledge. It is not necessary to copy them, but they are an education and teach much that may be a help.

The work of November should be exceptionally good, because on it, and the month that follows, depend largely your increased sales of holiday goods and novelties.

READ YOUR TRADE JOURNAL.

You have more time for this in the long nights of November than in many of the previous months, and much is to be gained from their careful going over. They are full of bright advertising ideas, as full indeed as any high class magazine.

There are articles and essays in many of them that are gems of information, both as to the trade and the outside world. The markets are as reliable as any to be secured elsewhere. They are full of the new things of the world, indeed the merchant who in these days neglects the trade journal is far behind just where he should be, and might be, far to the front. To men who take them and carefully study them it is a mystery why, with the small investment necessary, every merchant in business should not provide himself with one or more.

NOVEMBER FOR EARLY CLOSING HOURS.

It should begin them if they do not already exist, and in many towns of the West and Middle West the barbaric closing at 9 and 10 o'clock exists, and holds good all the year. The average day laborer has provided himself with an eight-hour day for his work. The machine shop, the foundry, the average dry goods house provides but eight hours. Yet hundreds of Hardwaremen in every State make slaves of themselves and their employees for 16 hours out of the 24.

It is due to the proprietor, and it is certainly due to those he employs that at least the evenings of the winter months be their own, to do as they will. No day laborer works any harder than the average Hardwareman; to no class should his evenings come nearer being due, for recreation, for reading, for the building up of the man. The State associations through local ones have been instrumental in bringing this about in a few towns in the States, at least for three or four months of the year. It should be universal, and early closing should hold for every month of the 12. More and better work is done, and this is an opportune time to take the matter in hand.

NOVEMBER A GOOD MONTH IN ANY BUSINESS.

A splendid one for collections—as a rule, all classes of people have money then, if at any time during the year. A good month to look forward and look backward, to know what you have done, and to see pretty well what you expect to do in the months to come.

As a rule, it is a prosperous month in nearly all lines, and it's largely what we make it, on through the month that follows to the first of the year.

Let's push it along, and push ourselves with it, for all the good things it has to give us.

There is evidence of a record breaking consumption of iron and steel. The mills are filled up with orders well beyond the end of the year, and pig iron stocks are decreasing, notwithstanding enhanced production at the blast furnaces.

European Warm Air Furnaces.

BY CHAS. F. HAUSS, BERLIN.

This construction of heating apparatus is known principally as a "calorifer," in practice is made in many

These, as is the case with the average American warm air furnace, had a very low efficiency, were easily overheated and burned out, which led to the construction of various styles of furnace, shown in the accompanying cuts, which provide principally for a horizontal travel of the products of combustion, and have a large

EUROPEAN WARM AIR FURNACES.

forms, the material used in its construction being mostly cast iron, although wrought iron and tile are used occasionally.

The oldest type of furnace was made of smooth cast iron tubes, either vertical or horizontal, connected into headers, through which the products of combustion were carried, usually by the shortest route, to the chimney.

percentage of extended surface to prevent the fire surface from attaining a red heat. The fire pots of some are lined with fire clay, others are built entirely of fire brick or tile, only the fire surfaces being of cast iron. To prevent cracking from expansion and contraction loose joints are provided. Where parts set on each other the joints are made with sand cups, and where horizontal tubes demand vertical joints these are made

with planed flange joints, or the one end of the tube being secured in the masoury, the other is allowed to expand and contract through a sort of stuffing box of sand. They are particular to make every provision for easy cleaning and repairing.

The portable furnace with a galvanized iron casing

daylight is not obtainable, care being taken to prevent any of the fumes or products of combustion of the gas entering the air chamber.

Fig. 14a.

EUROPEAN WARM AIR FURNACES.

is practically an unknown article in Europe, the furnaces being set in brick chambers, the inside walls of which are usually lined with glazed brick or tile. Then there is usually provision made for lighting the furnace chamber by setting into the side wall a double window and by having a gas burner outside this window where

The manhole doors are always double, and extreme care is used to insure the furnace chamber as well as the cold air supply duct being air as well as water tight, and all walls and ceilings over the furnace must be double, with an ample air space to prevent radiation in the cellar.

To insure an even temperature most furnaces are provided with a magazine feeder or a large fuel chamber, and in many cases with automatic regulators, which are connected to the draft door in the ash pit, and a check damper in the smoke flue, the smoke flue in most cases being underground and provided also with a slide damper, which is never allowed to cut off more than three-quarters of the area of the smoke flue. This latter is a police regulation in Germany and would be a good one if also enforced in America.

By inspecting the following illustrations the reader will note that the idea is to secure the largest amount of heating surface in the smallest space, and so divided as to distribute the heat to the best advantage and make it most effective; to have the smallest possible number of joints, and every necessary provision for expansion and contraction, as well as for cleaning. The forms shown indicate an effort to get as large a range of sizes

use of fuel, minimum amount of attention, and the smallest possible wear on the furnace, each square foot of smooth prime heating surface will give off 860 heat units, and each square foot of ribbed or extended surface will give off 650 heat units. Of course this is the minimum and could easily be doubled by increasing the rate of combustion and correspondingly reducing the economy.

The ratings of capacity for furnaces vary greatly, some giving the minimum, some the average and others the maximum ratings; but in every case they publish the actual fire surfaces and leave it to the engineer who plans the work to use any rating he chooses.

I happen to have a record of a furnace, shown in Fig. 1 and Fig. 1a, which has a fire brick combustion chamber and wrought iron return flues. This type of furnace is rated to heat from 300 to 500 cubic feet of space per square foot of heating surface. The case the

EUROPEAN WARM AIR FURNACES.

and capacities with the smallest number of patterns and parts as possible.

The best authorities agree that even though there is no limit to the size of warm air furnaces, to secure economy it should at all times be recommended that a single furnace should not have more than say 325 square feet of heating surface, and where more surface is needed to use two or more furnaces in a battery, as it is impossible to fire a large apparatus economically during the spring and fall, when only a fraction of the power is necessary.

With a properly constructed apparatus the smoke and gases should enter the smoke flue at from 500 to 580 degrees F.—that is, during the first firing up, and after the building is warmed and the apparatus is working regularly the gases should enter the smoke flue at from 320 to 400 degrees F.

The heated air should enter the rooms at from 100 to 130 degrees, and according to one authority the temperature of the heating surface should, if possible, be kept below 400 degrees F. Under these conditions, which, of course, are the best as regards economy in the

writer has in mind is a church in central Germany, in which there are two furnaces, each having 285 square feet of surface. The church contains in round numbers 285,000 cubic feet of space; therefore each square foot of heating surface is warming 500 cubic feet of air. The air to be heated is drawn from the church itself, and on a day with the outside temperature at 12 degrees the temperature of the air in the church was raised to 54 degrees in six hours' time, using 1080 pounds of good bituminous coal, besides the wood, &c., necessary to start the fire. The body of the combustion chamber of this furnace is also of wrought iron, has a magazine feeder and an angle or step grate, in addition to the shaking flat grate. This is one of the earliest types of furnaces made and is still much in use.

Fig. 2 shows a furnace of the same general type, the difference being principally that cast iron is used entirely with extended surface, instead of smooth wrought iron surface.

Fig. 3 shows a furnace of cast iron and wrought iron made in Austria, the body of which is used without the wrought iron tubes, or with tubes on one side, as shown

in Fig. 5, or on both sides, as shown in Fig. 3. This same body is used in the furnaces shown in Figs. 5, 6 and 7, and has a grate 16 x 18 inches. With this one size of base and grate the manufacturer makes 45 sizes of furnace of the style shown in Figs. 3, 5 and 7.

For instance, those illustrated in Fig. 5 are made in seven sizes, and each size in three styles—that is, the body only, or with pipes on one side only, and with pipes on both sides, making in all 21 sizes, of which the smallest and largest are rated as follows:

Fig. 19.

Fig. 19a.—Elevation at c d.

Fig. 19b.—Plan at e f.

Size.	—Body only.—		—Pipes on one side.—		—Pipes both sides.—	
	Square feet of fire surface.	Heats of space.	Square feet of fire surface.	Heats of space.	Square feet of fire surface.	Heats of space.
No. 1	57	18,500	73	24,000	90	28,000
No. 7	85	30,000	115	37,000	130	42,500

The first three sizes have one section between the fire door and ash pit door, as shown in Fig. 3, then one, two or three sections above the fire door. The four larger sizes have two sections between the fire door and ash pit door, as shown in Fig. 5, and the different number of sections above the fire door.

Fig. 3a is the same style of furnace with a round grate and fire pot and a casing the same as an American ventilating stove.

Fig. 4 shows practically the same style of furnace, except that it has a brick lined fire pot of larger capacity and a most peculiar arrangement of fire surface, in that the webs or fins that surround the different cast

sections are also carried into the inside of these sections, the inventor claiming that surface which gives off heat ought to be just as good to take it up. In this furnace the fire is built in the cylinder E, in which the products of combustion rise to connecting pipe C, through which they pass into and down through cylinder F to their exit in smoke pipe P, which connects them with the chimney flue S. This type of furnace gives a large amount of heating surface in a small amount of space, and a variety of sizes with few patterns.

Fig. 5 shows the same furnace fire pot as shown in Fig. 3 and described under that number. The use that this type of furnace is built for is shown in the plan, Fig. 8.

Fig. 20.

Fig. 20a.

Fig. 21.

Fig. 21a.

EUROPEAN WARM AIR FURNACES.

Fig. 6 shows the same fire pot again with cast iron extension sections and elbows on top, and with wrought iron diving flue at the rear.

Fig. 7 shows the same furnace with a cast iron diving flue all covered with fins or extended surface. Both of these last named furnaces can be enlarged by adding sections above and below the fire pot and in the horizontal and rear sections. Those shown in Fig. 7 range in size from 172 to 330 square feet of heating surface each, and are rated to heat from 63,000 to 90,000 cubic feet of space.

While the writer admits that from a commercial point of view this type of furnace would be all right, in that with small outlay and a small stock a very large number of sizes of furnaces can be furnished, his early training in the furnace business will not allow him to admire or recommend this type of furnace. It is the writer's thought that even though the ratings are apparently

conservative enough, the grate surface ought to increase as the fire or heating surface increases.

Fig. 9 is another furnace of this same general type with round fire pot and wrought iron down draft flues same as Fig. 3a.

Fig. 10 shows a furnace built entirely of tile or fire brick. The principal objection to this type of furnace is the difficulty in cleaning it properly. Its principal advantage lies in its ability to store the heat and give it off slowly and evenly. The fire and products of combustion pass up from the grate to and over the bridge wall, then down and up through the different flues as they are numbered, to the rear, then to the front again until they find their exit in the chimney flue numbered 13. The flues marked *x x x* are the warm air flues leading to the different rooms.

Fig. 11 shows an all cast iron furnace used for heating military barracks. These furnaces are cast in two pieces—that is, two halves, which are bolted together. They are provided with a long magazine feeder and covered entirely with flanges or extended surface.

Fig. 12 shows a very large cast iron furnace of a modern type, with tile fire pot and combustion chamber and cast iron extended fire surface, so arranged that one section can be set beside another, and that the grate surface increases with the fire surface, the grate being always of exactly the size necessary to burn the amount of fuel required to furnish the quantity of heat desired. This furnace has a magazine feeder and angle grate.

Fig. 13 shows another simple all cast iron furnace, of the same style as Fig. 11, but in connection with it is shown the cold air settling chamber A, the screen B, through which the air passes via the pit to the hot air chamber C. The water pan W is filled through the funnel F. It will be noted that the water pan is hung over the furnace, whereas all American manufacturers put the water pan as near the bottom of the furnace as possible.

In every European hot air heating apparatus a water pan is considered as necessary as the grate, and in the better class of work the size of the water pan, its area and the number of heat units required to evaporate a certain amount of water from a certain temperature per hour are figured as accurately as any other part of the apparatus.

Fig. 14 shows another of the more modern styles of cast iron furnaces with tile lined fire pot and cast iron horizontal return flue bottom radiators. The gases pass as indicated by the arrows and find their exit in the chimney flue under the floor at the rear of the furnace.

Fig. 15 shows a freak type of furnace similar to some American constructions. It has a brick lined horse-shoe shaped fire pot and a series of smooth cast iron tubes all around. The gases pass into and down through the tubes; then all these streams of gas meet under the furnace ash pit and enter the smoke flue under the floor immediately in front of the furnace.

Fig. 16 shows an all cast iron, round, brick lined fire pot furnace of limited size and smaller type, with two oval cast iron diving flues, through which the gases enter the smoke pipe at the bottom.

Figs. 17 and 18 show furnaces made by the same manufacturer, having brick lined fire pots, all cast iron combustion chambers and triple flat cast iron radiators, through which the gases reach the large smoke chamber in the rear. The fire pots, which are provided with a magazine, are alike in both furnaces, and to change the amount of fire surface different lengths of radiators are used.

Fig. 19 shows a more complicated style of all cast iron furnace, with brick lined fire pot, magazine feed, with an angle as well as a horizontal grate, and with provision for admitting air above the grate through the three square holes diagonally shaded and shown in the sectional elevation *a b*, which latter, when properly regulated, would insure a perfect burning of the gases of combustion. In this furnace the gases pass upward into the large top header or manifold A, then forward through the double tier of tubes B, back through tier C, forward again through tier D, and back through tier E, into the bottom manifold F, where the different currents of gas combine and find their exit through the

smoke pipe H. Though this is an efficient furnace, there are too many joints to be made with gaskets or putty to make it desirable.

Fig. 20 shows a slab sectional furnace that admits of a most accurate arrangement of the amount of fire surface wanted in an apparatus. The fire chamber is a large roomy affair, provided with a magazine and double grate similar to that described in Fig. 12, and has the dome A as well as the horizontal central flue B lined throughout with fire brick, through which the gases of combustion pass to be distributed into the slab sections on either side, then downward through the slab diving flues C into the bottom manifold D, by which they are passed to their exit in the chimney flue S. The upper joints are made with asbestos gaskets between the planed flange joints, while the bottom joints are made with sand filled cup joints, which allows for proper expansion and contraction. The cold air is introduced through an underground air duct under the center of the furnace and passes between the several slab sections, the extended surface of which is all placed at an angle of 45 degrees. By this method of bringing in the air a positive heating of the same is insured, hence this furnace ought to be especially desirable in blower systems of heating.

Fig. 21 shows the furnace most used in Europe. It has a tile lined fire chamber, with magazine and angle grate in the front and tile return flues forming the rear end. These two ends are connected with straight flanged tubes, fastened firmly in the front wall, and expand and contract through a cast iron plate, behind which is the sand that makes the gas joint yet allows perfect freedom of movement to the pipes. The gases travel as indicated by the arrows to the chimney flue S. The tubes are arranged in alternate tiers of three and two tubes, as shown.

In estimating on furnace heating the European engineers figure, in their painstaking way, the exact number of heat units required to heat the given space, allowing for all losses through walls, floors and ceilings, as well as the amount of heat lost by ventilation, knowing in advance the velocity of the air and very closely how much fuel is to be burned.

The size of grates for furnaces should be as follows:

Fuel used.	of fuel per hour is—	The free air space necessary to promote proper combustion is the following per cent. of the total grate surface.
Anthracite coal....	12.3 to 14.6 square feet.	33 1/3 to 50 per cent.
Bituminous coal....	6.8 to 7.7 " "	33 1/3 to 50 " "
Lignite	9.8 to 11.8 " "	20 to 33 1/3 " "
Wood or peat.....	9.0 to 10.0 " "	15 to 20 " "
Coke	4.3 to 5.5 " "	33 1/3 to 50 " "

* Where a magazine feed or large fire chamber is used, these sizes can be reduced 25 to 30 per cent.

The Baltimore Stove Trade.

A very satisfactory fall trade is reported by nearly every one of the manufacturers and dealers in stoves, ranges and heating goods in Baltimore, Md. The business done is said to be larger and more substantial than that of last season. The fall season generally was late in opening, but when deliveries began to be ordered both manufacturers and dealers were overwhelmed with demands for early shipment. Sales have been heavy in nearly all lines of goods. Heaters and ranges, as well as oil and gas goods, have sold equally well. An extensive demand for sheet goods is noted, but owing to the scarcity of sheets there has been considerable delay in the deliveries on this class of goods. Some manufacturers are beginning to feel the customary fall slackening off, their customers being stocked up. With the present moderate climatic conditions no heavy renewal orders have been received as yet. The Southern trade has been a very good one this season and a large quantity of goods have been shipped into that territory. Another very gratifying feature of the trade in that section is the promptness with which settlements are being made. This is taken to be indicative of the prosperous condition of that portion of the country at this time.

Victor Stoves and Ranges.

The Victor Stove Company, Salem, Ohio, are issuing to the trade a 56-page catalogue, tastefully bound in a dark green cover and well printed and illustrated. Following the title page is a well arranged index. The terms of the house are given, and it is pointed out that the transportation company are responsible to the consignee for all damage sustained by breakage after the goods have been received in good order from the shipper. The first section of the catalogue is devoted to the Victor Belle, a square, high oven, portable range, made with the oven on the left hand, and the Victor Model, a range of the same type made with the oven right or left. These ranges are made with end hearths for burning soft coal or wood and are equipped with high shelves, hot closet, reservoir, oven shelf, towel racks and oven door kicker. They are made with ovens 18, 20 and 22 inches wide, and with 8 and 9 inch covers. The Victor Crown and Victor Prize are cook stoves provided with similar conveniences. The Grand B, Falcon B and Victor Grand are ranges that have established a reputation in the trade, while the Victor Faicon is a popular cook stove. In another section of the catalogue are shown the Victor Oak stoves designed for burning either coal or wood and provided with hot blast pipe for burning soft coal. These stoves are provided with the usual air tight ash pit, nickel plated foot rails and trimmings. For large work the stove is made with an extra high body. The Victor Lark and Victor Cottage are small wood stoves. The Champion Box stove is designed for burning wood 36 inches long. The Victor parlor cook is a small square stove with an oven adapted for burning coal, wood or natural gas. The Royal Cannon is a globe stove of modern construction adapted for shops and stores. The last two pages of the publication refer to stove polish, stove scrapers, cover lifters, stove dealers' supplies and the standard two piece stove cover.

ODD PLATES.

THE KANSAS CITY FURNACE PIPE COMPANY of Kansas City, Mo., have been chartered with a capital stock of \$5000 by E. L. Salmon, Day K. Smith and R. S. Mitchell.

A FIRE recently occurred at the plant of the Duffy-Trowbridge Stove Mfg. Company of Hannibal, Mo. The principal damage was done in the warehouse, which contained 30 carloads of Stoves, all of which were more or less damaged. The fire, however, did not reach the foundry or the mounting shop, which are being run at their full capacity. The company state that they are able to take care of their orders even at this season with a reasonable degree of promptness.

At this season of the year Stove men are frequently called upon to make quick repairs to the fire chambers of Stoves. In this connection George Callahan & Co., 218 Front street, New York, call special attention to their dry No Clinker Stove Lining. This Cement can be mixed in quantity for the work, and is said not only to be proof against cracks and crumbling, but also to prevent the adherence of clinkers to a fire chamber lined with it. Stove Putty, Stove Enamels and Furnace Cement are other specialties of the house.

THE J. F. PEASE FURNACE COMPANY, LIMITED, Toronto, Canada, made a fine display of Wood and Coal Furnaces, Combination Heaters and Boilers at the recent Industrial Exhibition in that city.

THE INDIANAPOLIS PASTE COMPANY of Indianapolis, Ind., are sending to the trade a 12-page pamphlet devoted to the different varieties of Paste which they make for use of manufacturers of different articles. Their E Paste is especially adapted for attaching labels to tin, and is suitable for packers of fruit and vegetables. A special Paste is made for attaching asbestos pipe covering to hot air pipes of furnaces and steam and hot water pipes on heating apparatus. It is claimed that the special feature of this Paste is that the materials which it connects stick together permanently.

At the recent Toronto Industrial Exhibition one of the most attractive displays in the Stove line was that made by Clare Brothers & Co. of Preston, Canada. It consisted of a complete line of their specialties in the way of Stoves, Ranges and Heaters, a prominent feature being their Hecla Furnace, designed for using coal or wood as a fuel. In order to meet varying requirements the manufacturers have brought out five sizes of this heater, the largest being suitable for schools, churches and public buildings. Visitors who were interested in the problem of hot water heating had their attention drawn to the Preston Boiler, which provides vertical circulation, with its waterways thoroughly surrounded by fire.

THE CAMPBELL FURNACE COMPANY of Des Moines, Iowa, are doing a large amount of work at quite a distance from their headquarters. The company have changed the business method of handling Furnaces, and now install every plant with their own expert workers. They are placing a Heater in the home of A. J. Hoban of St. Paul, and are installing them in Middle Nebraska and Kansas, Southern, Middle and Northern Missouri, as far south as Albuquerque, N. M., and as far west as Colorado Springs, Col.

WE understand that the New Home Furnace Company of Norwalk, Conn., have made arrangements to have their New Home Furnaces manufactured at the Plainfield Foundry, where they will be finished and shipped direct.

E. SEIDEL, F. Grolshagen and O. Seidel advise us that they have established a Pattern shop under the name of the Milwaukee Pattern Works, at 515 Cedar street, Milwaukee, Wis. The members of the new firm, having been long and prominently active in the art of Pattern making, express themselves as confident of their ability to satisfy the demand made upon them in that line. They are prepared to do all kinds of work and have the facilities for furnishing sketches and drawings for ornamental and Stove Patterns.

UNDER the name Gas King, B. B. Christie, Dayton, Ohio, has patented both a Heating Stove and a Hot Air Furnace for burning natural gas, which can also be readily adapted for using oil fuel. In operation they are said to have demonstrated a high efficiency. Patents are to be taken out in Canada, Great Britain and other countries, and contracts to manufacture on a royalty can be made with Mr. Christie.

THE GOODWIN MFG. COMPANY of Topeka, Kan., have recently been organized to manufacture an improved Stove Pipe Collar and Patent Flue Stop.

THE plant of the Jackson Novelty Works, manufacturers of Oil Stoves, at Jackson, Mich., was visited by a fire last week, inflicting a loss of about \$3000.

The Double Hook Endless Garment Hanger.

The improved garment hanger shown herewith is being introduced by Charles P. Dodge, 67 Payne street, Lowell, Mass. The hanger is referred to as being made

The Double Hook Endless Garment Hanger.

of the best steel wire, bent and twisted into proper form, and tinned with the best triple plate tin. The peculiar feature of the hanger is that it has no ends or seams of any kind, and that the hook is double twisted. It is remarked that the hanger will not tear garments or roughen even the softest of velvet collars; also that the hook will not bend out of form, thus making the hanger adapted to hard, heavy work. The manufacturer states that the price of the hanger is low, that the quality is good and that it is guaranteed to give satisfaction.

A THANKSGIVING DAY STOVE WINDOW.

BY BUSY.

Several years ago I took up with the suggestions made in *The Metal Worker* of using the national custom of enjoying a Thanksgiving dinner for the purpose of working off stove stock and increasing my sales and profits. It is fortunate for the stove trade that the Thanksgiving dinner custom is so widely honored and observed, for even those stove men who do not make any special preparation to increase their trade on this annual occurrence do sell here and there a new stove, some grates, fire bricks or house furnishing goods that would not be purchased if they were not needed for the annual feast. I have a corner in my mind where I store things to be disposed of at my Thanksgiving Day stove sale, and have found that I can do a very nice bit of business, after the natural trade of the season is closed, by making special preparations to enable the people of my locality to have their cooking and heating apparatus

I shall run up a planished iron pipe and place on it one of the fuel saving smoke pipe radiators that are so generally advertised. To this will be attached a placard, saying: "Put It Upstairs. It Will Warm a Chamber." I shall use the lower part for a cast iron floor thimble, bearing a card, saying: "No Fires with Our Floor Thimbles." Near the hearth of the range I shall have a coal hod, and by it a coal sieve, a fire shovel, a clinker slicer and one of the convenient clinker pickers that are now frequently sold.

I shall also have a good sized market basket containing some apples for the apple sauce, and alongside of it a good sized granite pan with cranberries for the cranberry sauce. On the opposite side of the window I shall pile up some big golden pumpkins, and lay on top of them some meat choppers, suggestive of mince pie. In the oven I shall put some cake pans and on the floor, in front of the range, a large oval platter, with the carving knife and fork suggestively crossed upon it. Beside it will be a large roasting pan for the turkey, and in the

A Thanksgiving Day Stove Window.

in good order, so that they may be well fed and kept comfortably warm on the day of Thanksgiving.

This year I intend to have a Thanksgiving Day stove window, and I intend to trim it so as to attract attention—that, I find, is the most essential feature of any advertising. I have also found that to attract attention without satisfying it is a greater crime than to live and do business in an obscure way. For this year I have prepared a red banner, on which there are white letters stating "Here's the Place to Get Ready for Your Thanksgiving Dinner." This is large enough to stretch across the sidewalk in front of my store, so that no passerby can miss it. I intend to put this out and trim my window on the Friday night of November 15. This will attract the attention of the people who come to town from the country on Saturday to do their shopping, as well as that of the school children and shoppers in town. I will have the advantage of two Saturdays previous to Thanksgiving.

I intend to use the range which I am making my leader as the central feature of my display. This range has a high shelf, upon which I will put a tin bread pan covered with a towel. On the nickel plated tea shelves I will place on one side a coffee pot and on the other a teapot. On the top of the stove I will have a nickel plated tea kettle and a granite iron sauce pan. On the top of the warming shelf, opposite the bread pan, I shall put a corn popper. From the top of the warming shelf

pan a large basting spoon. I shall also have pans of walnuts and shell barks, and on them will display nickel plated nut cracks and nut picks, also the heavy japanned nut crackers so generally used.

The central feature of the window will be a big turkey bearing a placard, saying: "All this Fuss is Being Made for Me. I Am a Visitor from Bill Jones, the Butcher." Already I have arranged with our butcher to supply me the first week with a turkey with the feathers on, and the next week a turkey without feathers. This is my plan, and I give it so that anybody else that may want to draw attention to their store and thereby increase their trade for stoves, table cutlery and kitchen equipment, as well as stove pipe and grates and bricks, may profit by the suggestion.

THE INDIANA MFG. COMPANY, manufacturers of Hollow Ware and other Castings, Jeffersonville, Ind., have recently completed a factory of 100 fires capacity for the manufacture of Chain, and are at present making Trace, Wagon, Breast, Log Chain and Chain Dogs. They expect to make all kinds of special Chain up to 1 inch. The plant is referred to as equipped with the latest approved machinery, and under the direction of experienced hands. The company are also putting on the market a line of Enamelled Pitcher Pumps, the manufacture of which was commenced about a year ago.

Stove and Hardware Dealers.

EDWARD MILLER & Co. Meriden, Conn., have a very attractive exhibit in the Aceylene Building at the Pan-American Exposition. Included in the display is the Electrolite Acetylene Gas Table Lamp in many attractive finishes. They are also showing a large line of portables for commercial and acetylene gas. These portables are original designs and are made up in a variety of beautiful finishes.

THOS. A. NICHOLS, formerly a member of the firm of Nichols & Rankin, Stronghurst, Ill., has bought the Hardware, Stove, Tinware and Sporting Goods business of Frank Kupper, Burlington, Iowa, and will continue it under his own name. Mr. Nichols is making some improvements in the store and will enlarge the stock.

THE MCANDREW HARDWARE COMPANY, Bentonville, Ark., have been incorporated with a capital stock of \$6000. They will handle Shelf and Heavy Hardware, Stoves and Tinware, Agricultural Implements, Sporting Goods, &c., at retail.

D. R. BALL & SON have lately opened up in business in Juniata, Neb., handling at retail Shelf and Heavy Hardware, Stoves, Tinware and Sporting Goods.

H. H. BURLING has purchased the Hardware, Stove and Farm Implement business formerly carried on by J. F. Reller in Cortland, Neb.

J. C. BENDER has disposed of his Hardware, Stove and Harness business in Newport, Neb., to C. J. Reynolds, who continues at the old stand.

SMITH & STREHL have bought the Hardware, Stove, Tinware, Farm Implement and Bicycle stock of John D. Bonton, Monroe, N. Y. They report business as excellent, especially in the shop, repairing roofs, putting in Furnaces, Stoves, &c.

MURDOCK-DUNWIDDIE COMPANY have succeeded Frederick Hardware Company in Beloit, Wis., dealers in Shelf and Heavy Hardware, Stoves and Tinware, Sporting Goods, &c.

ANDERSON & WARNE are a new firm in Elburn, Ill. Their stock comprises Hardware, Stoves, Furnaces, furniture, &c.

WATERMAN HARDWARE COMPANY is the name of a new hardware concern, recently incorporated, who will open up November 15 at 141 South Pearl street, Albany, N. Y. They will deal in Builders' and General Hardware, Tools, Kitchen Utensils, &c., and will be pleased to receive from manufacturers illustrated catalogues, price-lists, quotations, &c.

JAS. E. CARSON of Fandon, Ill., has succeeded T. J. Bowman in the Hardware, Stove, Tinware, Agricultural Implement, Buggy and furniture business in Colchester, Ill.

THE UNITED STATES ALUMINUM COMPANY and the Aluminum Cooking Utensil Company were incorporated last week by interests of the Pittsburgh Reduction Company, makers of Aluminum. The companies are to operate in connection with the works at Niagara Falls and New Kensington. Various Aluminum Specialties are to be produced. The first company have named as their capital \$25,000, the other \$10,000. The incorporators are R. B. Mellon, A. K. Lawrie and Arthur V. Davis of Pittsburgh; R. E. Withers, Jr., Parnassus, and C. M. Hall, Niagara Falls, all connected with the Pittsburgh Reduction Company.

THE GRAND MFG. COMPANY have been incorporated at Milwaukee, Wis., with a capital stock of \$25,000, to manufacture the Grand Washing Machine. The incorporators are Hamilton J. Matthews, Joseph R. Schreck, Fred. E. Wittenberg and Dr. Thomas Fitzgibbon.

THE S. M. HOWES COMPANY, 40-46 Union street, Boston, Mass., have just issued a 40-page illustrated catalogue of the Fire Place Goods made of brass, wrought iron and cast iron, which they are producing. The goods shown include handsome styles of Portable Basket Grates, Brass and Wrought Iron Andirons, Brass and Iron Fire Sets and Fenders, Coal Hods, Folding Screens, Spark Guards, Wood Baskets, Gas Logs, Fire

Place Dampers, Ash Pit Doors, Boiler Grates and Boiler Doors, together with some handsome styles of Bellows. The Ash Pit and Boiler Doors made by the company are a new design, and include a reversible pattern. They are held in position with detachable straps and flange of the door frame. In inserting these doors it is unnecessary to cut the bricks, as the straps are secured in the seams and the frames are of such dimensions that they come even with the course of the bricks.

THE LALANCE & GROSJEAN MFG. COMPANY, 19-21 Cliff street, New York, have issued, under date of November 1, 1901, a new and revised catalogue and price-list of their Agate Nickel Steel, Pearl Agate, Peerless, Blue and White, All White and Regal Steel Enameled Wares. The catalogue is of 136 pages, and is illustrated by numerous half-tone engravings, showing examples of the long line of articles in Enameled Ware manufactured by the concern. The various styles of ware are illustrated in colors. An exhaustive index at the end of the book is a useful feature. The present publication contains a number of new and useful articles that have been added to the company's assortment. Views of their immense factory at Woodhaven, L. I., their rolling mills and tin plate works at Harrisburg, Pa., and their handsome sample rooms in New York City are given at the beginning of the book. We are advised that the Lalance & Grosjean Mfg. Company and the National Enameling & Stamping Company have adopted uniform prices on all of their Enameled Goods.

W. J. BURTON & Co., Detroit, Mich., are sending out a circular to the trade giving information as to how the firm assist dealers to sell Burton's Fuel Economizer. The company state that they advertise in more than 1000 newspapers and other publications, and each advertisement refers prospective purchasers to the nearest dealer handling their goods. If no dealer in a town carries the Economizer and they are forced to sell the customer direct, they charge the consumer's price, which is about 50 per cent. more than the price to dealers, thus protecting the dealer. With each dealer's order they send catalogues, circulars and cards, and attractive hangers for the salesroom or show window, also an electrotpe for local newspaper advertising, if requested.

THE plant of the Brass & Copper Company, at Bloomsburg, Pa., which has been idle for the past few years, has been leased by the Sterrick Steam Cooker Company, who will adapt it to the manufacture of their Cookers.

THE AMERICAN WASHBOARD COMPANY's plant, at Cleveland, Ohio, was totally destroyed by a fire caused by a spark from a passing engine. The loss in machinery, stock and buildings amounted to about \$100,000.

Scrap Lead and Zinc.

By far the greater portion of the lead produced, says the *Lead and Zinc News*, is converted into white lead, red lead and orange material, which are used as pigments of paints, distributed over great surfaces in such thin coatings that their metallic contents is practically never recovered. A good deal of lead is manufactured into sheet, and a considerable portion into bullets, shot and other projectiles; and, though still remaining in a metallic form, it is so widely distributed in use as to cause it to be irrecoverable in the form of scrap. A portion of the lead product used as sheet lead and pipe does come back into the market, but the portion of lead used in these ways is comparatively small as compared with the other uses of the metal.

The consumption of zinc is largely in galvanizing steel or iron sheets, in the manufacture of brass, as sheet zinc and as the oxide of zinc used as a pigment in paint. That portion of the metal which is used in galvanizing is distributed as a thin covering over a large surface of iron, and the metal is entirely lost in the oxidizing and general disintegration of the zinc sheet. It has never been attempted to recover the zinc from galvanized iron. Zinc which is manufactured into brass, in the proportion of one-third zinc to two-thirds copper, remains in a permanent form, which is often available for new use as scrap brass, and, next to iron and steel, is the largest commodity in the scrap metal market.

A Crude Oil Portable Heating Furnace.

The furnace herewith illustrated is one of a variety of furnaces which have been placed on the market by the Union Drop Forge Company, 64 East Ohio street, Chicago. These furnaces embody a method of burning crude oil for fuel which was developed in the works of this company for their own special purposes. The distinctive feature of this system consists in vaporizing the oil with an air blast, the arrangement for doing which is complete in the burner itself. The blast is furnished by an ordinary blower, the pressure found most effective being about 8 ounces.

The burner, Fig. 2, devised for this purpose is simple in its construction and consequently cannot easily get out of order. It consists of a hollow or chambered casting, with passages for oil and air at one end and a nozzle at the other. The oil is delivered in the center of the chamber through a small pipe. Projecting over the orifice of this pipe inside the chamber are three pins which are so placed as to almost touch at the center of the orifice and which cause the oil to be broken into

to provide a thoroughly practical method of teaching the principles and practice of effective advertising. Classes are held on Wednesday and Friday evenings from 7.30 to 9 o'clock, the instruction being given at a comparatively moderate cost. The facilities which are offered by this course will no doubt be appreciated by many young men entering business, as well as by others who are engaged in any business which requires the aid of advertising for its success, and there are few lines of business nowadays that do not use this means for extending trade.

The Shawinigan Falls Aluminum Plant.

On Saturday, October 19, the new aluminum plant of the Pittsburgh Reduction Company, at Shawinigan Falls, was formally started. The works of the Shawinigan Water & Power Company are so far completed that the power station from which power is supplied to the Pittsburgh Reduction Company was formally put in operation, and aluminum is now being manufactured in the Dominion of Canada.

The Shawinigan Falls development is effected by means of a canal about 1000 feet long, 100 feet wide and 20 feet deep at low water, by which the water is conducted to a forebay, from which the water is conducted in steel tubes 9 feet in diameter. Three of these tubes are now in place and three are in process of construction. There are two power houses situated at the foot of a fall of 125 feet.

The power house from which the Pittsburgh Reduc-

CRUDE OIL PORTABLE HEATING FURNACE.

particles, or scattered. The air passes into the chamber through a much larger opening and completely surrounds the oil pipe, thus thoroughly mingling with the oil as it is discharged into the burner. The chamber has its diameter enlarged toward the nozzle, but at the nozzle it is considerably reduced. This causes the flame to spread and be diffused over a wide area, completely filling the interior of the furnace to which the burner may be attached.

These furnaces are built for forging, annealing, hardening, or for other purposes in which iron or steel is to be heated. The same system is also adapted to burning crude oil in raising steam. In burning the oil on a large scale, it is vaporized by a jet of steam delivered to the burner from the boiler. The company have found in using this system that they are securing remarkably economical results as compared with the process of reducing or making gas through any intermediate method of treatment. The use of their burner insures a perfectly regulated fire, thus affording greater uniformity in generating steam for boilers or heat for forges and furnaces than with coal.

We have received from the Peirce School of Philadelphia an attractive pamphlet setting forth the advantages offered by the new course in advertising which has been begun at that institution this season under the direction of E. St. Elmo Lewis, an advertising specialist of that city. The course, as outlined seems

Fig. 2.

tion Company obtain their current contains two water wheels of 3000 horse-power capacity each, made by the Dayton Globe Iron Works of Dayton, Ohio. To each of these wheels are connected two direct current 300-volt generators of 1000 kw. capacity. The current generated by these machines is conducted over aluminum conductors, running through an inclosed passageway to the Pittsburgh Reduction Company's works, located on the hill about 175 feet above the power station and 400 feet distant.

In the main power station of the Shawinigan Water & Power Company there are two of the 5000 horse-power generators erected, while two of the largest water wheels ever built are being erected. These wheels each have a capacity of 6000 horse-power under a head of 125 feet, and are made by the I. P. Morris Company of Philadelphia.

About $\frac{1}{2}$ a mile from these power houses is the mill of the Belgo-Canadian Pulp Company. The Shawinigan Water and Power Company will supply this mill with water by means of a development separate and distinct from the canal above mentioned. This water will be taken from the river $\frac{1}{2}$ a mile above the power canal and discharged into the Shawinigan River, which empties into the St. Maurice River, below the falls. This development is under construction.

The officers of the Shawinigan Water & Power Company are: President, J. N. Greenshields, Montreal; vice-president, John Joyce, Andover, Mass.; secretary, R. W.

Douglas, Montreal; treasurer, J. E. Aldred, Boston, Mass.; chief engineer, Wallace C. Johnson, Niagara Falls, N. Y. The capital of the company is \$6,000,000.

Decision on Aluminum Patents.

Judge Hazel has rendered his decision in one of the most important cases ever heard in the United States Court of the Western District of New York. In the decision Judge Hazel dismisses the action brought by the Electric Smelting & Reducing Company against the Pittsburgh Reduction Company of Niagara Falls. The action was an equity proceeding brought against the Pittsburgh Reduction Company for an alleged infringement of a patented process for cheaply separating aluminum by the use of electricity. It was begun in Circuit Court, April 6, 1897, and was argued the following December. In the complaint it was alleged that the Pittsburgh Reduction Company, in all of their plants, one in Pittsburgh and two in Niagara Falls, infringed two patents relating to the reduction of metal from an ore by the use of an electric current, which patents were owned by the complainants. Many expert witnesses were sworn, and the exhibits made were numerous. The testimony taken amounted in all to over 3000 printed pages.

In his decision Judge Hazel held that the defendant company did not infringe the patents of the plaintiff, which, in effect, means that the Pittsburgh Reduction Company will be allowed to continue the manufacture of aluminum. As this company can make the article by their process much cheaper than by any other known process, it follows that the company practically have a monopoly of the manufacture of aluminum.

Judge Hazel's decision is set forth in 40 typewritten pages, and in it he reviews the case at great length, going over much of the testimony, cites many opinions of other judges, and gives a brief history of the reduction of metals by electrolysis. The two patents owned by the complaining company were issued to the inventor, Charles C. Bradley, in 1892. They relate to a process of reducing highly refractory and non-conducting metallic ores in a fused state by electrolysis—that is, by subjecting the ore or compound to an electric current, to fuse it and, while in fusion by action of the current, to separate or decompose the fluid mass so that the metal contained in it will be deposited at one of the two poles of the electric heater. Three clauses of one of the patents cover the process broadly. Three others of the same patent cover specifically the process to be used in the reduction of aluminum. The other patent covers a special mode of practicing the process.

The defense made various answers, among which was want of novelty in the patents. The alleged infringement was denied. The Pittsburgh Reduction Company said that they worked under a patent given in 1899 to an inventor, C. M. Hall. The two processes covered by the three patents are very similar. In fact, the suit just decided may be looked upon as a return suit, for shortly before the present one was started the Pittsburgh Reduction Company sued the Cowles Smelting & Aluminum Company in an attempt to get damages for and stop the infringement of the Hall patent. The Cowles Company were the predecessors of the Electric Smelting & Aluminum Company. Nothing was accomplished by the suit, except that various technical terms were defined, and there was established a fixed meaning that greatly aided in the trying of the present case.

The opinion states that the Bradley process was never put into practical operation. The complainant argued that Bradley was the pioneer in that field, and so was entitled to many benefits and everything relating to the process. But to quote from the opinion:

"Hall, ambitious, vigorous and intellectually strong, experimented and produced a process in aid of decomposition of refractory ores not contemplated by the complainants' patents."

It was stated in the opinion that the entire consumption of aluminum in the United States is supplied by the Pittsburgh Reduction Company; that in 1886 the price of aluminum ranged from \$5 to \$8 a pound, that in

1897 the price was about 25 or 30 cents a pound; that at first, when the Pittsburgh plant of the defendant company was started, only 50 pounds were produced daily; that soon afterward two large plants were built in Niagara Falls, using a total of 6000 electrical horse-power and producing daily 9000 pounds of aluminum.

In reaching a decision Judge Hazel was guided somewhat by the previous suit. He held that Hall's invention was not an alteration of Bradley's process, and that one ingredient in the chemical bath used had not been substituted for another. The decision was extremely technical. Judge Hazel went to great length in studying both processes for the reduction of aluminum.

The Besly Band Polishing Machine.

The new band polishing machine built by Chas. H. Besly & Co., 10 North Canal street, Chicago, has a very desirable form of stand, as it permits the operator to be seated while at work. The illustration shows not only the machine proper, but the countershaft and a dozen assorted emery cloth bands. These machines are so made that a single band wheel can be used, or they can

The Besly Band Polishing Machine.

be fitted with a double spindle so that two band wheels may be used, or a band wheel can be placed at one end and a regular buff or emery wheel at the other end of the spindle.

The band wheels recommended to be used on this machine are made of semisteel castings, and when an elastic surface is required they are covered with felt. The emery or other abrasive material is applied to the wheel on a cloth band which may be tightened firmly around the wheel. To reset the wheel or change the grade of emery, it is merely necessary to remove the band and replace it with another, the operation requiring only one or two minutes. The Besly band wheels are made with cushioned or with hard finish, whichever may be desired.

In operating this machine the work is held under the wheel by the operator. The wheel will work up sharp corners, being especially advantageous on die work. The assortment of emery cloth bands furnished with each wheel consists of eight or ten different grades.

THE EMPIRE METAL COMPANY, Syracuse, N. Y., are putting out a new Solder for Aluminum, which they claim to do the work with efficiency. The Solder is described as being of the same color as Aluminum, as durable, tough and strong, flowing smoothly and adhering firmly. It needs no flux and can be handled easily with an ordinary soldering iron or blow pipe in the same manner as common tinner's Solder. It also solders Brass as well as Aluminum.

Hot Water Heating.

BY E. T. CHILD.

Of the many details to be considered in designing a hot water heating system, the first to receive attention is naturally the size of the radiators to be used. If the water temperature for an open system is assumed at 180 to 200 degrees F., with a temperature of 70 degrees F. in the room, the difference of temperature of air and radiating surface is 110 to 130 degrees F. Allowing 2 British thermal units for each square foot of radiator surface per hour for each degree of difference between water and air gives a radiating power of 220 to 260 British thermal units per square foot of surface. If this result is compared with low pressure steam work, a logical conclusion may be reached. Assuming steam at 5 pounds gauge pressure, or 227 degrees F., and air at 70 degrees, the difference is 157 degrees, and on the same basis each square foot will evolve 314 British thermal units per hour. Then, using 180 degrees as the water temperature, 314 square feet of water surface

Hot Water Heating.—Fig. 1.—Chart for Determining the Size of Pipes.

will equal 220 square feet of steam surface, which shows it to be about 70 per cent. as effective.

In *The Metal Worker* of November 11, 1899, a comparison of methods for calculating steam radiating surface is given. As the different rules show such a diversity, let us assume that 1 square foot of steam radiating surface will heat 60 cubic feet of space. Then a hot water radiator will heat 70 per cent. as much, or 42 cubic feet. This factor is about the average of figures given by various authorities.

For indirect work there seems to be a general agreement that it requires 50 per cent. more radiating surface than is required for direct. It may be shown that this allowance is ample by a simple illustration.

Assume a room containing 4200 cubic feet of space. This for direct radiation will require 100 square feet of radiating surface. If an indirect coil is used an allowance should be made to change the air in the room at least four times an hour, making 16,800 cubic feet to be heated from 0 to 70 degrees, over and above what would be done by the 100 square feet of direct coil. To heat this volume from 0 to 70 degrees will require, omitting intermediate figures, about 22,000 British thermal units, which, added to the work of 100 square feet of direct radiating surface at 220 British thermal units

per square foot, will aggregate 44,000 British thermal units per hour for the indirect stack. On account of the higher velocity of air flow, and lower entering temperature of air, each square foot of indirect coil will radiate more heat than direct, and it is safe to allow 330 British thermal units per square foot, instead of 220 in the case of direct; therefore an indirect radiator containing 133 1-3 square feet will be required. Of course, a great deal depends upon the entering temperature, velocity of flow and rate of air change, and 50 per cent. is a safe figure to allow.

Having determined upon the radiator sizes, the next thing in order is pipe connections. A great deal de-

Fig. 2.—Proper Branch Connections.

pends upon the height of the radiator above the heater and the capacity of a pipe to supply radiators increases as the difference in level changes. This is clearly shown by the chart given in Fig. 1, which has been plotted from figures given by the Nason Mfg. Company. The radiator location should be borne in mind. If it is at the end of a run the pipe should be kept full size to allow for the extra distance. The use of large radiators requiring larger than 1 1/2-inch pipe should be avoided. The main pipe should be allowed at least 1 square inch of area for each 100 square feet of direct surface.

In arranging runs of piping each installation should be made a special study. It is necessary to first locate all the radiators, then the heater, and lastly they must be connected in the most direct manner possible. Radiators on different floors should be so placed that a single riser may feed two or more, and all horizontal runs should be as short as possible. No horizontal run should have a pitch less than 1 inch in 10 feet, and if the head room available is sufficient it would be well to grade the runs steeper. Sometimes horizontal pipes are run one size larger than the risers. In taking off branches care must be taken that one will not rob another. This is particularly liable to happen in the case of a straight run to the floor above, and may be avoided by using a smaller pipe to the upper floor, as shown in Fig. 1 by C, or by taking the connection off on one side, as in Fig. 1 at A, and Fig. 4. Do not make two con-

Fig. 3.—Wrong Connection.

Fig. 4.—Connection for Favoring Radiator on Lower Floor.

nections from a tee to two radiators, as in Fig. 3. Instead, use any one of those shown in Fig. 1.

The expansion tank may be connected up in several ways. One is to connect the bottom of the tank by a separate line direct to the bottom of the heater; another is to connect to the return after it has left the last radiator on the line nearest to the tank. Sometimes both flow and return are connected to the bottom of the tank, as in Fig. 5. The tank should set at least 2 feet above the top of the highest radiator, and as much higher as

possible. It should be large enough to hold at least one-twentieth of the water in the entire system, as water on being heated from 40 to 212 degrees will expand one-twenty-fourth of its volume. A vent pipe should be provided, with an overflow pipe. Fig. 6 shows the most desirable arrangement for piping an expansion tank. This makes the tank to a certain extent a radiator, and prevents all possibility of its ever freezing. The proper connection of the expansion tank is most

diators, but the connection shown by Fig. 7 is preferable.

3. The regular two-pipe system, in which the flow and return pipes are both run in the basement, and are graded back to the heater, the branches being run from the main upward, and the radiators fed on the rise. This last is the system most commonly employed and it is admitted to be satisfactory. The greatest objection is its larger first cost. It gives a free circulation, but is liable to develop inequalities due to small errors in design and construction.

The second system is claimed by many to be superior to all others, and under certain conditions it certainly will work most satisfactorily. If there is no objection to running the pipes on the attic or top floor ceiling the principal difficulty will be overcome. This system may be used for high pressure hot water or low pressure steam heating, or it may be used for low pressure hot water heating with an open tank. It is possible to fit the radiators with a single connection from the drop pipes, but it is more satisfactory to use a special radiator, as shown in Fig. 7. Butterfly valves, or gate valves, are most satisfactory for hot water work, as they offer less resistance than globe valves. Fig. 8 shows the disadvantage of a globe valve.

The one-pipe system is least to be recommended, as it is very slow to circulate, and therefore could not be relied upon in an emergency, nor with large work having many connections.

Another important factor to be considered is the heater size, including grate area, heating surface and smoke pipe or chimney area. This selection is no doubt in a majority of instances left to the manufacturer, but it is none the less important that the contractor should be well posted and know what he needs.

The heating surface of a hot water heater should equal from 10 to 12½ per cent. of the radiating surface, although on small installations it may run as high as 15 to 20 per cent. Kent gives a factor of 1 square foot of heating surface to 5 square feet of radiating surface, while the factors given by Carpenter vary from 1 to 6.8 on 250 square feet of radiation to 1 to 10.5 on 10,000 square feet of radiation.

The grate area should vary from 1 square foot to every 30 square feet of heating surface on a small heater for approximately 500 square feet of radiation to 1 square foot to every 40 square feet of heating surface on a very large heater. The smoke pipe should be allowed about 30 square inches for each square foot of grate surface. Following the above rules, 1000 square feet of radiation will require 125 square feet of heating surface, the grate area will be 4.16 square feet, and the smoke flue 125 square inches, or approximately 13 inches in diameter. Ten thousand square feet radiation will require 1000 square feet heating surface, the grate area will be 25 square feet and the smoke flue 750 square inches, or 31 inches in diameter. With the above rules in view, it will be an easy matter to decide upon what it is necessary to provide between these two limits.

FRED. BROOKS, an employee of the Brooks Plumbing Company of Des Moines, Iowa, met his death on October 24 from suffocation, being buried in a sewer trench which he was digging. The soil was of a sandy character, and while he was working 10 feet below the ground the walls caved in. Although a number of men immediately set to work digging him out, he died on being brought to the surface of the ground. He was 24 years old and had been married but five weeks.

THE new plant of the Eastern Tube Company, at Zanesville, Ohio, is practically completed and is in operation. This concern are prepared to turn out tubes from ½ to 16 inches in diameter. Their plant is a large one and has modern equipment throughout. The general offices of the concern are in the Pittsburgh Bank for Savings Building, in Pittsburgh, with C. E. Corbett, general manager, in charge. The officials of the company are: F. A. Beall, president; E. C. Card, treasurer, and Joseph H. Beall, secretary.

Fig. 5.—An Expansion Tank Connection.

Fig. 6.—A Circulating Connection to Expansion Tank.

important, and the method shown in Fig. 6 is by far the best.

A discussion of the various systems of piping will no doubt bring forth varied opinions, and probably leave the reader to draw his own conclusions. There are three systems to be considered: 1. The one-pipe system, in which the main is kept of the same size all around the cellar, the flow connections being taken off from the top of the main, and the returns being brought back into the side of the same main. The main pipe is carried straight up from the heater to the highest point in the cellar, and is then run either dead level, or pitched slightly downward to the end where it is returned to the bottom of the heater.

2. The complete circuit or drop pipe system. This was described by Peclet as used in France in 1830,

Fig. 7.—Method of Connecting Radiator to Drop System.

Fig. 8.—Showing Disadvantage of Setting Globe Valve with Stem Vertical.

was used by Perkins in England about 1840, and in this country it is spoken of as the "Mills" system. In this system a main, or several mains, are carried to the top of the building, where all the horizontal pipes are run, either in the attic or on the top floor ceiling, and the radiators are fed by drop pipes, which continue down to the basement, where they are brought together into a main return, which is run to the bottom of the heater. Sometimes the drop pipes are so arranged that all the circulation must pass through the different ra-

Central Supply Association.

The annual meeting of the Central Supply Association was held in Chicago last week, when, after transacting the routine business and admitting to membership J. J. Ryan & Co. of Chicago, and the Cleveland Plumbing Supply Company of Cleveland, Ohio, the following officers were elected for the ensuing year:

President, E. A. Morris, Detroit, Mich.

First Vice-president, A. F. Gartz, Chicago, Ill.

Second Vice-president, J. B. Rahm, Omaha, Neb.

Treasurer, E. T. Niedecken, Milwaukee, Wis.

Secretary, Paul Blatchford, 1610 Ashland Block, Chicago, Ill.

Executive Committee.

E. A. Morris, Detroit, Mich.

A. F. Gartz, Chicago, Ill.

J. B. Rahm, Omaha, Neb.

E. F. Niedecken, Milwaukee, Wis.

N. O. Nelson, St. Louis, Mo.

John W. Wolff, Chicago, Ill.

G. H. Merkel, Cincinnati, Ohio.

Theodore Ahrens, Jr., Louisville, Ky.

Representatives in National Committee of Confederated Supply Associations.

N. O. Nelson, St. Louis, Mo.

A. F. Gartz, Chicago, Ill.

Francis J. Torrance, Pittsburgh, Pa.

A. D. Sanders, Chicago, Ill.

John Walker, Detroit, Mich.

Alternates.

Theodore Ahrens, Jr., Louisville, Ky.

G. H. Merkel, Cincinnati, Ohio.

D. F. Sullivan, Dallas, Texas.

J. M. Young, Pittsburgh, Pa.

L. C. Huesman, Union City, Ind.

The next meeting of the association will probably be held at Cleveland, Ohio, in February.

Lamb & Ritchie's Pan-American Exhibit.

A novelty which has attracted considerable attention at the Pan-American Exposition is exhibited in Section 25 of the Machinery Building by Lamb & Ritchie, Cambridgeport, Mass. It is tin lined or lead lined wrought iron pipe, in which the lining is not only thick enough to constitute a substantial inner pipe, but is also inseparable from the iron. The inclosure of the section is attractively made of pipe, and some 10-foot lengths are stacked up at the back, while others are suspended in such a manner as to allow electric light to show the polished surface of the tin lining. Samples are shown bent and coiled and there are sections of pipe twisted to prove that the lining is inseparable from the pipe. Neither bending nor hot water, it is stated, will cause the pipe and lining to separate; and this, we are advised, has been established beyond question by nearly two years of actual use under the most trying conditions.

Mott's Imperial Victorian Solid Porcelain Fixtures.

A conspicuous feature of the many attractions at the Pan-American Exposition at Buffalo, N. Y., for those who delight in furnishing their homes with handsome plumbing fixtures was the exhibit of the Imperial Victorian solid porcelain bathtubs, lavatories, seat baths and closets made by the J. L. Mott Iron Works, Beekman and Cliff streets, New York. These fixtures were shown to the best advantage in a model bathroom finished with exquisite taste, and it is not strange that the company were awarded a gold medal by the commissioners for their exhibit. The goods displayed are of the same general character as those receiving a similar award at the Paris Exposition, where they attracted attention which has resulted in large orders from several foreign countries.

From being large importers of foreign made solid porcelain ware in the past, the J. L. Mott Iron Works have become exporters of a far handsomer product from their own factories at Trenton, N. J. A feature of the American made goods is the absence of the oppressive bulk and clumsiness of European goods. A characteristic peculiar to them is a grace in contour and beauty in the ornamental shapes produced, which effectually destroys excessive massiveness, and contributes a strik-

ing attractiveness that has already created a demand for them from the architects of fine residences and from their clients. The bathtubs are made in a variety of styles and shapes, with underglaze decorations and ornamental relief work of artistic merit. The lavatories are made to stand out apart from the walls and in shape, design and ornamentation are equally attractive. The closets and other fixtures have an appearance in keeping with these handsome productions. These goods have a pure white finish of high gloss and great smoothness that adds greatly to their general beauty.

FORCED BLAST HEATING.

A paper which was read a short time ago before the New York State Medical Society by Dr. Henry Reed Hopkins of Buffalo, chairman of the Committee on Hygiene, on the subject of heating and ventilating school buildings, in which the fan system of ventilation in use in the schools of Syracuse was discussed, displayed a strong opposition to such heating systems. Among other things Dr. Hopkins is reported to have said:

The fan system of ventilation is a failure in inlet work, a more pronounced failure in outlet work, a failure in diffusion, a failure in displacement, a failure in the removal of air borne excrement, a failure in the removal of carbon dioxide. That 141 different observations made in the rooms of seven schools showed not one instance of efficient ventilation as measured by motion of air at the outlets, and that in the tests of 196 different rooms of nine schools there was found 165 failures, as indicated by carbon-dioxide, and, further, that in the rooms found to have adequate ventilation 0.53 of such ventilation was due to accidental causes—to the motion of air independent of either inlets or outlets. That this is a question of great importance, inasmuch as the matter of ventilation of school rooms is not only one of comfort and convenience, but is essential to the preservation of health.

That the fan system is a demonstrated failure as an air supply, entirely lacking in uniformity and quantity and diffusion, as complete a failure in performance as it is absurd in principle, the surprise being that sane men would ever undertake to supplant and displace the simple method of natural air supply by anything so complicated and artificial as the fan system; remembering that to human beings air supply is at once a comfort and convenience and essential to health, and is also an instant, constant and immediate necessity to the maintenance of life.

That ideal school ventilation and air supply is a scientific question of absorbing interest, not alone because of the intricate questions of physics, chemistry and physiology involved, but also in view of the fact that the tender, delicate and susceptible children of to-day, with their fearful liability to disease, liability to arrest of development of body, soul and spirit, are to-morrow the people.

It is unfortunate that such statements should be made in reference to a system of heating which is increasing in popularity, not only in the United States, but in England, France and Germany. In all these countries the best engineers, having long since passed the experimental stage, agree that forced blast heating has demonstrated its excellence and established its position among modern methods. That all blower systems of heating have not equally well accomplished the desired result is due rather to faulty design and detail than to the system itself. It has been the experience in every field of engineering that wherever excellence has been obtained many attempt to utilize the necessary apparatus without fully understanding the underlying principles. In these cases it is but natural that their application of the principles should result in faulty apparatus and failure to duplicate the success attending the operation of the best systems. While the arraignment of this system above given may be of interest, it is doubtful if this broad condemnation will act as any serious check to the forced blast branch of the heating industry.

R. G. PARSONS, secretary of the Board of Public Works of Buffalo, N. Y., will receive bids until November 7 for the roofing, plumbing and gas fitting of a two-story building to be occupied by the crew of a city fire boat.

Michael Carney.

Michael Carney, well known throughout Northern New York as a prominent heating contractor and hardware merchant, died on Friday, October 25, at his home in Philmont, N. Y., at the age of 52 years. Mr. Carney had been a sufferer from asthma for a number of years, and that, combined with a severe cold which he contracted, developed into pleuro-pneumonia, causing his death. He was born in Ireland and at the age of nine years came to this country, receiving his early education in the public schools of Hoosick, N. Y. He served an apprenticeship at the plumbing and steam fitting trades in North Adams, Mass., where later, as a journeyman, he worked for a considerable time. He left North Adams and went to Albany, N. Y., and there with Perry & Co., stove manufacturers, he developed into an overseer of exceptional ability. In 1880 he engaged in the heating and hardware business in Philmont, N. Y., where a steady, healthy business growth rewarded his industry and fair dealing. Nearly every heating plant of importance installed in Columbia County during the past five years was his work. Mr. Carney is survived by two sons and a daughter. The funeral, which was in charge of Hudson Council, 316, Knights of Columbus, took place from the Sacred Heart Church, Philmont, and the interment was made at that place. Wm. E. Carney, son of the deceased, continues the business.

Pierce Sanitary Specialties.

The Pierce, Butler & Pierce Mfg. Company, Syracuse, N. Y., have issued a new catalogue of 64 pages, covering their line of bathroom specialties. In the introduction the company impress upon plumbers, architects and others that they are prepared to furnish everything in the line of plumbing and sanitary goods for equipping fine residences, and that they make, as well, a line of heating boilers and radiators. The first section of the catalogue is devoted to solid porcelain bathtubs of French and Roman patterns, the Roman pattern being shown both on feet and on the base. These are followed by several styles of high grade roll rim porcelain enameled bathtubs and the Onondaga Junior, a steel clad copper lined bathtub. Handsome marble lavatories, with brackets and legs made in various designs and equipped with a variety of styles of supply and waste fixtures and traps occupy another section of the book. A line of water closets shown includes wash down and siphon jet closets, made with both high and low flush tanks, and with the company's new vertical vent connection. In the last part of the catalogue attention is given to bathroom fittings of nickel plated brass, including supply and waste fixtures for bathtubs and lavatories with traps, supply pipes and air chambers, lavatory legs, basin cocks, chain stays, flush and supply pipes, tanks, seats and brackets, as well as a great variety of towel racks, sponge and soap holders, bathtub seats, tooth brush holders and mirrors. The catalogue closes with a well arranged index.

Eccentric Fittings and Their Uses.

The eccentric fitting, says the London *Ironmonger*, is as yet comparatively novel, and its varieties are confined to three—viz., the eccentric reducing socket, bushing and tee. An eccentric tee may be used where no other fitting would answer the purpose. One was used where a 3-inch one-pipe horizontal hot water main circuit had its highest point tight against a ceiling and its 1½-inch expansion pipe had to come there. This pipe could not be carried away vertically at once, but had to go horizontally (with a slight rise) for about 10 feet. Had an ordinary reducing tee been used the expansion outlet would have come central, and therefore would not have released the air along the upper part of the pipe; but with an eccentric tee, with the outlet out of the center (eccentric), and level with the top of the pipe, the 1½-inch horizontal expansion pipe took all the air from the 3-inch main.

When reducing horizontal hot water mains, for any reason, it is most desirable to use a reducing socket

with the small opening out of the center, with its top edge level with the upper edge of the large opening. By this means the upper line of both the small and the large pipes are brought level, and the air passes along just the same as if all the pipe were of one size. This is not necessary when there is a vertical branch on the large pipe close to the reducing point, but otherwise it is important.

With steam work these reducing fittings answer an equally useful purpose, only that they are required to drain away condense water instead of providing means for air to escape. Consequently they are used with the small opening low down instead of high up, so that the bottom edges of both pipes are in a line, and not the top edges.

Golf In the Heating and Plumbing Trade.

For some time past the supply trade in the heating and plumbing field in Chicago have enjoyed the preparation for a golf tournament, which was completed at West Hinsdale, on October 25. There were 42 contestants and a goodly number of admiring friends assembled in the golf gallery to lend *éclat* to the event. Prizes in the shape of three handsome cups inspired the "lofters" to "put" themselves in 18 holes, with the greatest possible expedition and the least possible "swats." The cups were donated, respectively, by the Kewanee Boiler Company, the *Engineering Review* and *Domestic Engineering*. Another cup was won by D. E. McCabe of the International Heater Company, who can probably locate the donor. He averaged nine "swats" to the hole, yet his industry did not seem to win the honor accorded to S. O. Dugger of the Western Tube Company, who could only put four and seventh-ninths "swats" into the hole, which was about the size of a tomato can. However, Mr. Dugger got both of the newspaper cups, while C. K. Foster of the American Radiator Company played an "ideal" game, and scooped the Kewanee Boiler Company's prize.

There are some who feel satisfied that the same winners cannot do it again, and among them is J. B. Rahm of Omaha, Neb., and the medal winners, F. H. Lindenberg, John D. Hibbard, E. H. Raymond and George H. Bailey. The tournament was so thoroughly a success, and so fully enjoyed, that it is probable that another will be held early next season. This is said to be the first contest of the sort where all the competitors were from one trade, and S. O. Dugger, who was the originator of the project and chairman of the committee that made it a success, is being congratulated by his many friends on the pleasure they have derived from the event.

Death of New York Plumbers

Three well-known members of the Association of Master Plumbers of New York have died lately. John J. Santry, treasurer of the Richmond branch of the association, passed away last week. His funeral services, which took place October 25 from his late residence in New Brighton, Staten Island, were largely attended by many of his friends and the members of organizations to which he belonged.

Andrew J. McCarthy, formerly foreman for John Tucker, and lately in business at Park avenue and Fifty-eighth street, was buried from St. Francis de Sales Church on October 31. The master and journeyman plumbers of the city were well represented at his funeral.

Michael J. McDermott, president of the Bronx Borough branch and also of Manhattan branch of the association, died suddenly last Wednesday morning at his residence, 1791 Bathgate avenue. The funeral services will be held at St. Joseph's Church, Washington avenue, on November 2 at 9.30 a.m. Mr. McDermott was active in Democratic politics in the Bronx and was a member of the General Committee of Tammany Hall, besides belonging to several clubs.

T. J. Cronin has moved his plumbing establishment to Binghamton, N. Y.

Plumbing and Lead Work in the Olden Time.

In an address recently delivered by the president of the Royal Institute of British Architects, says the *Decorators' Gazette and Plumbers' Review* of London, the speaker referred to what apparently at the present day was the main requirement at the hands of the plumber—viz., the wiping of joints so that they may be air tight, and that the health of the community should not be lowered by the exhalations from faulty pipe connections. At the same time he deplored the fact that there are no evidences at the present day of the skill of the plumbers of the olden time, who embodied in their work the beauties of nature and art. He referred to his early impressions as a boy, when studying the exhibits in the plumber's shop window was one of his greatest delights; for in it were beautifully ornamented cisterns, lead vases, lead statues and ornamental lead plaques for dates and inscriptions, not to speak of the quaint, if not beautiful, rain water pipes and heads. All this had departed; and certainly every architect and every person of taste is anxious to see it revived. Some of the walks in Hampton Court Gardens are still adorned with leaden statues and leaden vases, and at the time of which he spoke the gardens of the great merchants in the city were adorned in the same manner, and very often with lead fountains, too.

In the Middle Ages and in the early Renaissance considerable portions of buildings then erected were ornamented with leaden crestings on the roof; there were lead tops to pinnacles and lead sockets to weathercocks, and the lead work to the lights was made in beautiful or curious patterns. He did not know why all these charming applications of design should be utterly laid aside and forgotten for more utilitarian objects. The exercise of the artistic part of the craft must surely give more pleasure and pride to the craftsman than the mere wiping of a joint or the beating out of a cesspool, however well done, besides the interest and pleasure that it causes to the public.

That the plumber of to-day, so far as being an artistic craftsman in lead work, is behind the plumber of the olden time there is no denying. In the early ages of civilization he was an important factor, but in the present utilitarian age, when machinery has taken the place of the human artificer, the average plumber's practical acquaintance with lead work goes little further than wiping a joint, adjusting a pipe or lining a tank. All the other work in which the plumber is interested comes ready made to his hand, needing only his skill in the arrangement.

EARLY USE OF LEAD.

The work of the plumber seems to have been the earliest application of human ingenuity to the working of metals. The use of lead is mentioned in the books of the Old Testament, and among the Egyptian fishermen it was made use of to sink their nets, as at the present time. It was adopted as a material for covering roofs, and as far back as the building of the hanging gardens of Babylon by Nebuchadnezzar (B.C. 588) it was practically used in sheet form as a "safe" under the earth in the gardens to retain the moisture in the soil necessary for the sustenance of the trees and flowers. The casting of the lead into sheets for this purpose on beds of sand dates back at least to this period in the world's history, and the union of the sheets was effected by means of solder of the same composition as in present use, as recorded by Pliny, who does not, however, refer to lead burning, which probably was not known at that early date.

To conceive an idea of the magnitude of the work of providing lead "safes," so to speak, for the terraces composing the hanging gardens, some account of the magnitude of the undertaking should be given. As already stated, they were erected by Nebuchadnezzar about the time when the prophet Daniel was taken captive and brought to Babylon. The motive for their erection is given by historians as follows: Amytis, the wife of Nebuchadnezzar, was a Mede, and was accustomed before her marriage to the luxuriant hills and

forests of her own country. Babylon, on the contrary, was situated on an immense level plain, and the queen felt the depressing effect of the change of scene. It was to supply the loss in part that the king had the gardens constructed in terraces, one above the other, to the top of the city walls; and as history places these walls at 350 feet in height, the magnitude of the undertaking of casting the lead sheets necessary to cover the area of the gardens and to sustain the load of earth sufficient to fasten the growth of large forest trees may well create wonder at the present day.

WATER SUPPLY.

The main water supply for these gardens was procured from the river Euphrates, but the question of how it was raised, and what was the character of the hydraulic machine which effected it is still, so far as we know, unsettled. All that has been recorded is that "upon the uppermost of these terraces was a reservoir supplied by a certain engine, from whence the gardens on the other terraces were supplied" by means of lead pipes. What was the caliber of the vertical suction pipe of 350 feet in length used or the strength of the lead used in its manufacture history does not record, and we are left to adopt any theory which seems the most plausible.

There is no information extant as to the method adopted by the Babylonian plumbers in the manufacture of lead pipe, but as the plumbers of ancient Rome later on presumably followed the fashion of the earlier plumbers, we are enabled to afford some light in this direction. The pipes as made by the Roman plumber were made from sheet lead, the strips being cut and rolled so that the edges came together. These were then soldered and the pipe was complete. They were made in lengths of 10 feet and in various sizes, ranging from 1 to 12 inches in caliber, the weight of the sheet lead corresponding in thickness with the size of the bore and the strain it would necessarily have to bear.

It was also customary in cases where pipes supplied the baths of wealthy individuals to have the owners' names engraved on the pipes, and in other places the makers' names. Some idea may be formed of the extent of this pipe manufacture when it is stated on good authority that from one of the Roman aqueducts alone no less than 13,594 lead pipes of 1-inch bore drew water supply for as many buildings. The consumption of lead, therefore, must have been enormous in Rome at that period, and the work of the plumber correspondingly remunerative. It is also to be remembered that in addition to work in connection with water supply the plumber was kept busy as a roofer, lead being the principal roof covering in the East.

New York City Notes.

John McMillan has just finished the job of overhauling the entire plumbing in the Park Avenue Hotel, putting in all new lines and fixtures. He is also busy with the power houses for the elevated railroad, having the contracts for the two down town houses and one at 161st street and Third avenue.

* * *

A relic of old times is the desk chair used by John Byrns and which formerly was used by Mr. Philbin of Philbin & Quinn, the father of the present District Attorney.

* * *

Trade still continues brisk and with prospects of remaining so for some time. Among the jobs well under way is one on Ninth street west of Third avenue, where A. Reitmayer is plumbing two five-story flats. Samuel Lytle has two eight-story apartment houses in the same locality. Kelly Bros. of Amsterdam avenue are busy with three eight-story apartments on 107th street west of Amsterdam avenue.

SYMONS & RAE, architects, of Toronto, Canada, will receive bids until November 11 for central heating, power and electric plants for the Queen's University and School of Mines Buildings at Kingston, Ontario.

Sanitary Uses for Slate.

One of the first requisites for a material to be applied to sanitary purposes, says *Cement and Slate*, is that it must be impervious to all liquids, non-absorbent and capable of being readily cleaned. Any material that will absorb the liquids or gases that come in contact with it affords a resting place for impurities, and will in time become only a breeding place for all kinds of disease germs, thus defeating the very purpose for which it is used.

Some substances are given a smooth, non-absorbing surface artificially, which, while it lasts, will do all that is required of it in the way of keeping the utensil clean, but when once destroyed by cracking or otherwise is worse than useless, for it presents a better receptacle for filth than would an ordinary semi-porous stone.

It should be possible to clean the surface of all such materials used in what is known as sanitary construction easily and simply. For this purpose it is necessary that all such constructions be made with perfect joints and a polished surface. There are a few mineral products which answer these requirements. The first stone that was ever used extensively for this purpose was marble. This forms an ideal material in all respects but price. The difficulty experienced in quarrying it and the waste produced in preparing thin slabs of it for market are objections that will never be overcome. It is hard, fine grained and impervious to liquids and gases, but its price prohibits its use in any but the higher grade of buildings.

A material that seems to be designed by nature for use where a clean, non-absorbent surface is required is slate. It meets all of these requirements, combined with strength and durability, and can be made neat and even beautiful where adornment is required. The surface is smooth, therefore it will not absorb oils or odorous or decaying organic matter; it is not affected by acids, in which respect it is better even than marble. It is impervious to water, air and changing weather conditions, and not sensibly affected by ordinary variations in the degree of heat. These qualities are not found in any other mineral product, and, taken in connection with the ease with which it can be worked and its consequent low price when compared with other materials used for the same purpose, it is really economical as well as highly satisfactory to use slate slabs for sanitary purposes.

The more fully builders and contractors realize the fact that slate has made a place for itself in the interior fittings of the building, as well as upon the roof, the more satisfactory work will they be able to turn out. Slate has the merit and is not endeavoring to obtain a position by favor which it cannot maintain by excellence. That this is true is shown by the increased call for mill stock. Builders are everywhere waking up to the fact that, to be up to date, they must use the most serviceable as well as the most economical fittings for their buildings. In the case of the sanitary construction slate fulfills these conditions.

Among the various uses to which slate is put for this purpose are bathtubs, urinals, wash trays, kitchen sinks, dairy uses, drainage, cisterns, grave vaults, &c. For all these purposes and many more the slate is prepared at the factory, according to measurements supplied by the contractor, and all that the latter has to do is to set the slate into place, after it has been set up and fitted at the factory before it is shipped.

Slate used for this purpose can be used either in its natural color, or it can be given any color or almost any figure desired. By the process of marbleizing slate all kinds of marble, granite, wood or tiling material can be imitated, if it is thought desirable, for the purpose of ornamentation, but the natural color of slate is of such a cleanly shade that in most cases it is used in its natural condition. These various properties are being better appreciated every day and slate will continue to find an increased market on account of them.

M. E. LYNCH has moved his plumbing business to a new store on Foster street, Peabody, Mass.

The P. and S. S. League.

Last Monday night the Ronalds & Johnson Company's Brooklyn team won two games in the Plumbing and Steam Supply League contests on the Monarch Alleys, New York City, and in one game tied the high team score of 827 made by Behrer & Co. R. W. Steves contributed a score of 195 to the total. The H. P. Read Lead Works team won and lost a game, C. V. Driggs making a score of 196. The team of Fred. Ade & Co. lost both their games. On Thursday night the team of John A. Murray lost two games, the C. S. Locke & Smith team split even, and the John Simmons Company's team won both their games. Their leader, Henry Maurer, Jr., marked a score of 186. The team score was 708, the highest for the evening. The first month of the tournament has closed, and the standing of the various teams is given below:

The Standing of the Teams for October.

Team.	Won.	Lost.	Team score.	Individual score.
Behrer & Co.....	4	0	827	198 M. Behrer.
John Simmons Company....	4	0	708	186 H. Maurer, Jr.
Thomas G. Knight.....	2	0	647	156 E. E. Benas.
Ronalds & Johnson Company,				
Brooklyn	3	1	827	195 R. V. Speves.
Crane Company.....	3	1	727	210 A. E. Good.
F. N. Du Bois & Co.....	2	2	728	163 E. E. Haff.
Central Foundry Company..	2	2	701	199 J. S. Dibley.
H. P. Read Lead Works....	2	2	689	196 C. V. Driggs.
C. S. Locke & Smith.....	2	2	657	155 C. A. Blanchard
Dimock & Fink Company....	1	3	684	167 A. B. Beith.
Ronalds & Johnson Company,				
New York.....	1	3	669	159 H. Boilman.
F. Ade & Co.....	1	3	575	166 F. R. Lowe.
Salesmen	0	2	702	194 R. C. Wilson.
E. F. Keating.....	0	2	525	149 F. J. McCarthy.
John A. Murray.....	0	4	576	141 G. W. Tilton.

Heating and Plumbing Notes.

FRED. GELINAS, secretary of the Department of Public Works at Ottawa, Canada, will receive bids until November 8 for a heating system for the post office at Digby, Nova Scotia.

JOHN GETZ & SONS, York, Pa., have been awarded the contract for equipping the factory of the Cosmo Carriage Company, at that place, with water closets and washstands on six floors of the building.

BOON & SAMPLE, Philadelphia, have the contract for plumbing the new station of the Pennsylvania Railroad at Thirty-second and Market streets, that city.

BRANDERLIES & SCHOLL will make a specialty of steam and hot water heating and hydraulic and automatic sprinkler work at their new plumbing establishment, 11 Columbia street, Utica, N. Y.

THE Mississippi State House Commission will hold their next meeting at Jackson, Miss., on Thursday, November 7, when they will award a contract for electric wiring, plumbing and steam heating the new Capitol Building.

CONTRACTS have been let for the erection of a brick warehouse and fire proof building for chemicals for the Ahrens & Ott Mfg. Company, Louisville, Ky.; also for a new enameling shop to replace the one recently burned.

THE KEYSTONE POTTERY, at Trenton, N. J., was visited by a fire on Sunday which did some thousands of dollars' worth of damage. The cause of the fire is unknown, but it is believed to have been of incendiary origin.

ROURKE BROS., New Haven, Conn., have taken the contract for the gas piping in the new Y. M. C. A. Building in that city. The contract will require about 20,000 feet of Pipe.

C. S. EAMES, Bridgeport, Conn., has taken the contract for plumbing and steam heating in the Congregational parsonage in Housatonic, Mass., and for remodeling the hot water heating in L. E. Fuller's residence in the same place.

THE BARLOW BROS. COMPANY, Waterbury, Conn., have the contract for the plumbing and heating of a new residence for S. L. Arthur. They are also heating the new office of the Farrell Foundry & Machine Company and

the residence of James Tobin, and are at work on a large contract at the new rolling mill of the Scovill Mfg. Company.

JENKINS BROTHERS, 71 John street, New York, advise us that they were awarded at the Pan-American Exposition at Buffalo a gold medal for their Valves, another gold medal for their 96 Packing and two silver medals for their rubber specialties.

THE DAVENPORT STEAM HEATING COMPANY of Davenport, Iowa, have a \$4000 contract for equipping the new Rock Island Depot with a plumbing system.

THE School Board of St. Louis, Mo., has decided to make an experiment in heating school buildings with Texas fuel oil, and to this end has made an appropriation for the equipment of the heating apparatus with suitable burners. Newell & Co., Beaumont, Texas, have offered to donate 20 cars of oil for the experiment, which will be made in the new Wyman School on Eads street.

L. E. LEWIS, manager of the King Earle Heater Company, 516 Harris avenue, Providence, R. I., is installing Furnaces in 19 houses in the city and suburbs.

THE BEST MFG. COMPANY of Pittsburgh, manufacturers of Valves, Castings and Piping, have just made shipment to Sydney, New South Wales, of some 260 tons of Pipe, Valves, Fittings, &c., to be installed in the central generating station of the Sydney City & Suburban Tramway system, which is to be equipped with \$800,000 worth of American machinery.

CHARLES D. HAUKE of Washington, D. C., has made application to the Board of City Commissioners of Youngstown, Ohio, for a franchise to erect a gas fuel plant in that city and pipe the streets for the purpose of supplying private customers with fuel gas. It is proposed to erect a very large plant in Youngstown to make fuel gas.

HENRY DUNKER, Davenport, Iowa, has the contract for plumbing the new school house and Sisters' Home that are being erected in St. Mary's parish.

JUSTICE WALTER LLOYD SMITH has granted an order for the dissolution of the Northcott Warming & Ventilating Company of Elmira, N. Y.

A COMMITTEE of the Master Plumbers' Association of Kansas City, Mo., composed of W. L. Hudson, Henry Goss, J. P. Cunningham, James Cotter, John McDonnell and J. L. Ryle, drafted resolutions on the death of Dent Yates, which were adopted and a copy forwarded to his bereaved family.

THE contract has been awarded for the erection of the foundations for the extensive new Bathtub and Sanitary Goods plant for the National Sanitary Company, at Monaca, Pa. The contract for the temporary water line for the new plant has been given to Elmer Sproull of Monaca.

CHARLES M. SHUSTER of Rochester, Pa., has been awarded the contract for plumbing the new High School building in that town.

THE Board of Health of Kalamazoo, Mich., has appointed on the Board of Examining Plumbers, in accordance with the State law, John A. Wheeler, master plumber, and Fred. Herman, journeyman plumber. The other members of the board are City Engineer Buckley, Water Commissioner Houston and Water Inspector Skinkel.

REINEKE, WILSON & Co., 13-19 Wood street, Pittsburgh, Pa., issue in the current number of *Trade Topics* a very attractive piece of printed matter calling attention to their Pumps, Water and Well Supplies, Gas Ranges, Acetylene Lamps, Chandeliers and a variety of Chain, Lift and Force Pumps.

WILLIAM O'BRIEN, Red Bank, N. J., is installing a steam heating plant in a large building for Patterson & Spinning.

THE Jersey City, Hoboken & Paterson Railway Company will receive bids at the office of T. Cressey, 800 Broad street, Newark, N. J., until November 15 for steam heating, water supply, plumbing and sewerage for a car barn and other buildings to be erected on their property on Market and Jersey streets, Paterson, N. J.

THE authorities of St. Paul, Minn., recently revoked the license of a plumber, owing to his persistency in doing work contrary to the plumbing regulations and because he used his license to report work done by other plumbers who had failed to secure a license.

New Firms and Changes.

It is reported that the plumbing firm of Miller & Johnston, Fall River, Mass., have dissolved partnership.

C. R. PRIME has opened a plumbing shop at Brandon, Vt.

THE LOETZER VALVE & MFG. COMPANY, Towanda, Pa., have acquired the plant of the Towanda Foundry Company, which they have refitted for the manufacture of their new line of Valves and Supplies, and for doing a general foundry and machine business. The necessary machinery will be installed in about ten days, and they expect to be in the market with their goods by the middle of November.

The Butler Leather Fillet.

The leather fillet manufactured by A. G. Butler of 103 Beekman street, New York, is constructed with geometrically perfect curved sides, which form a perfect arc of a circle when applied. The feather edges blend with the pattern so that there is no perceptible joint.

The Butler Leather Fillet.

The fillet can be applied to single or compound curves, or straight work, and no tacking or clamping is required.

Hydrogen in Acetylene Gas.

In a recent article on the analysis and purification of acetylene Rossel and Landriset quote figures which show that the proportion of hydrogen by volume in commercial acetylene usually ranges from 0.2 to 0.3 per cent., and does not exceed the latter limit even when the carbide is made in the presence of an excess of lime, says the *London Electrical Review*. Using an alternating current in the furnace, part of the lime excess volatilizes and part melts without decomposition, yielding a carbide of specially fine crystalline appearance; only the small residue is dissociated to metallic calcium, and, according to the present authors, only that part of the residue which happens to be in the middle of the finished lumps of carbide remains as metal and generates hydrogen when it comes in contact with water. Hydrogen in acetylene is objectionable, since, burning as it does with a non-luminous flame, it reduces the illuminating power of the crude gas. It is known that a considerable quantity of hydrogen may exist in acetylene when the gas has been generated in a faulty apparatus which encourages overheating, and the quantity may easily reach a figure that seriously affects the reading of the photometer. This hydrogen is due to various decompositions occurring in the process of evolution, and it can be totally avoided by proper construction of the generating plant. The hydrogen arising from the metallic calcium of the carbide is naturally unavoidable; but Rossel and Landriset clearly show that its amount is too small to be in the least degree sensible to the consumer. Indeed, it is difficult to understand how any appreciable amount of metallic calcium can appear in a material made in an alternating furnace, where true electrolysis is theoretically excluded.

SHEET METAL ROOFING.

One of the effects of the late steel strike that has been felt by manufacturers and dealers in sheet metal goods during the past season is a falling off in the sales of iron and steel roofing, metal shingles and tin roofing plates. The high price of sheet iron and terne plate and a scarcity of those materials due to the prolonged shut down of the mills conspired to limit the consumption and to stimulate the use of other roofing materials to a considerable extent. In respect of tin roofing, however, a gradual decrease in the use of terne plate for roofing purposes has been noted for some years past in various parts of the country, particularly in the East, where popular favor has been running more to metal and wood shingles, slate, tin and gravel, felt and other prepared roofings. This fact is conceded by tin plate jobbers throughout the Eastern section of the country, and it is also more or less noted in the Southern and Central States.

From many parts of the country come reports to the effect that slate roofing has made considerable progress in popular favor during the past season, and it is said that in a number of districts in the Eastern, Middle and Southern States slates have been placed on the roofs of new buildings in cases where formerly tin would have been used. Manufacturers and dealers in roofing slates refer to a decided increase in the demand for this material, and their reports are confirmed by the fact that the stocks of roofing slates have become depleted to an extent not known for years past, notwithstanding that the production has kept up to normal figures and in some cases has been increased over that of past years, while the export trade in slate has fallen off.

There is no doubt that the metal shingle has grown materially in popularity as a substitute for tin roofing during the past few years, while the various prepared roofings that are now offered in the market have secured considerable attention. In the Southern States, in particular, metal shingles have come into vogue in preference to tin plate. The reason advanced for this preference is that it has been found that tin roofing was expensive, owing to the climatic conditions which make it necessary to paint the tin roof every year. The use of metal shingles and sheet iron roofing in Southern cities is restricted to some extent at the present time, however, owing to their relatively high cost, due to excessive freight rates. This, however, is only a temporary condition, which, it is expected, will soon be relieved.

In districts where tin is still largely used for roofing purposes there has been a marked increase in the demand for the heavily coated old style plates in preference to the cheaper grades, which have not been found to stand the test of time and weather satisfactorily. The complaint is made in some quarters that much of the terne plate now produced deteriorates far more rapidly than that used in years gone by, the contention being advanced that the steel sheets of which most of the present day roofing plates are made corrode more readily than the iron sheets formerly used, and that the coating does not adhere as closely to the steel sheets as to the more fibrous iron sheets. A growing demand for tinned iron sheets is said to be a feature of the roofing trade at the present time, and some of the tin plate manufacturers are preparing to meet this call.

Changes Among Tin Plate Officials.

The American Tin Plate Company announce, in a circular letter to the trade, the resignation of Daniel G. Reid, president, and Warner Arms, second vice-president, of the company, as reported in our last issue; also the election to the presidency of W. T. Graham, formerly first vice-president; of W. M. Leeds, formerly third vice-president, as first vice-president, and of Frank Dickerson, general sales agent, as second vice-president. Mr. Dickerson, it is stated, will continue to retain charge of the sales department in addition to his new duties.

The resignation of Mr. Reid was made in order that he might devote the whole of his attention to the United States Steel Corporation, of which he is a member of the Executive Committee. Mr. Arms was the choice of

the directors for president in succession to Mr. Reid, but declined the office on the ground that he desired to relinquish active business cares after a continuous service of some 30 years in the iron and steel manufacturing industry. The loss of Mr. Arms' services cannot fail to be felt by the American Tin Plate Company on account of his intimate knowledge of and experience in the business. Mr. Arms was especially familiar with the labor conditions in the iron and steel trade. He was prominent during the recent labor troubles and those of former years, having acted as chairman of several committees appointed to carry on negotiations with the Amalgamated Association.

Tin Rivet Boxes.

One of the conveniences of every well equipped tin and sheet iron shop is a set of rivet boxes, a device of some antiquity. The early rivets were rough made and not as popular as the machine made rivets of to-day, and it is the general use of the modern true and smooth little rivets, black and tinned, that has made the rivet box not only a convenience, but a necessity. Yet there are shops where rivets are still kept in the original packages in which they are received. A hole is opened in one cor-

Tin Rivet Box.

ner, and when the rivets are desired for use some are sprinkled on the bench convenient to the workman, and, owing to the difficulty of putting the rivets that are not used back into the package, and the cheapness of them, many rivets are wasted by workmen, who, otherwise, are not inclined to be either slovenly or wasteful.

Where the shop has the wall space devoted to a set of rivet boxes properly marked, similar to that shown in the accompanying illustration, no time is wasted in hunting over a pile of boxes to get the size of rivet needed. It is only necessary to walk up to the wall and lift from its proper nail or hook the rivet box, take it to the work bench and lay it flat, when the rivets which it contains will spread themselves over the back, which now becomes the bottom. The opening is sufficiently large to allow the hand to pick up the rivets as needed. In this way the rivets are not likely to be swept off the bench in handling the work, but are always convenient to hand for use. The covered portion of the box need only be of sufficient size to hold a few more than one package. In many shops they are all of one size, large enough to hold, with ample space, a package of 3 or 4 pound rivets. In some shops the boxes are made in two sizes, the larger boxes having too much waste space for such small rivets as 1 pound.

The rivet box shown is modeled after the style used in the shop of Burritt & Montgomery, Norwalk, Conn., and is made 5½ inches high, 4¼ inches wide and 1 inch deep. In many shops the boxes are made perfectly round. In other shops they are made square at the bottom. This variety of style affords an opportunity for the tinsmith to display his taste or preference. In former times the apprentice might add a box or two or make similar boxes of larger size for stove bolts to try his skill as a budding tinsmith.

The Rolling Mill Company of America.

George J. Humbert, formerly with the Humbert Works of the American Tin Plate Company, at Connellsville, Pa., has succeeded in interesting some New York capitalists in South Connellsville as a manufacturing site, and as a consequence the Rolling Mill Company of America have been chartered under the laws of the State of New Jersey for the purpose of erecting and operating steel and iron rolling mills there. The plant when completed will consist of 20 sheet mills, open hearth steel plant and modern sheet bar mill, with a view of being independent of the market in the matter of bars from which the sheets are rolled, and will employ upward of 1200 men. The plans are prepared and bids are being received this week for the buildings and machinery. The latter will be completed at once for ten mills, and ten more will be added later at the convenience of the company. The plant will cost about \$500,000 when completed. The main building will be 110 x 400 feet, with water house and storehouse 50 x 250 feet and boiler house 45 x 80 feet. The buildings will be of steel and brick, and the whole plant of modern construction. The power will be furnished by two engines of 36-inch cylinder and 60-inch stroke, with fly wheels 34 feet in diameter and weighing 75 tons. These engines will be capable of developing 1000 horse-power each. A 15-ton electric traveling crane of 50-foot span will traverse the entire length of the main building. Two large picklers of the most modern pattern will be used in treating the plates. The large engines mentioned will drive all the heavy machinery, but the small machinery will be driven by electricity. The plant will be located just north of the plant of the Steel & Iron Aluminum Coating Company. It will occupy about 10 acres and will be completed and in operation in from six to eight months.

The Superior Combination Skylight and Ventilator.

We illustrate herewith, by means of a broken view, the new Superior combination skylight and ventilator that is being manufactured and sold by Akers &

The Superior Combination Skylight and Ventilator.

Harpham, 628 East Mill street, Akron, Ohio. The salient feature of the device is that it serves both as a skylight and ventilator. It is equipped with a sleeved damper, that shuts off the ventilator in the winter time or at other times when so desired, and at the same time leaves the light shaft entirely clear, not interfering in any way with the entrance of light. It is made of heavy galvanized iron and the top is constructed like a regulation skylight. The bars are made with condensation drip gutters, the skylight being closed with ¼-inch ribbed skylight glass. The manufacturers are prepared to furnish these ventilators with sheet metal top where light is not required. They state that they have already placed them on a number of factories, hotels, apartment houses, public buildings and private residences. The device is made in sizes from 12 inches to 120 inches in diameter.

The Kiskiminetas Valley Mills.

The Kiskiminetas Valley Mills of the American Sheet Steel Company embrace the Vandergrift works, at Vandergrift, containing 21 mills, to which eight will be added; the Hyde Park works, with five mills; the Saltsburg works, with four mills; the Leechburg plant, with ten mills, and the Apollo works, with six mills, a total of 46 mills, which will soon be increased to 54. All these mills are in charge of S. A. Davis, division superintendent, who makes his headquarters at Vandergrift. Some remarkable records have been made in these various mills, both as regards tonnage produced and economy in operation. On Monday, October 21, the mills named above turned out 631 tons of marketable sheets. This is certainly a very creditable record and reflects much credit on the efficient management of Mr. Davis.

FLASHINGS.

TILLMAN FUNK, who commenced a Tin, Slate and Gravel Roofing, plumbing and heating business at Gainesville, Ga., a few years since, has enlarged his business until he now finds it necessary to erect a new building two stories in height, 25 feet front and 144 feet deep, to accommodate his growing trade. His shop will be equipped with machinery to do heavy Sheet Iron work and Cornice making. He has recently done the metal work and gravel roofing on two new \$1,000,000 cotton mills built by the Paolet Mfg. Company in his city, and now has the contract to put in cotton dust conducting pipes that will amount to 8000 feet in length. He is doing the metal work and roofing on the Presbyterian church at Carrollton, and the metal work, slate roofing and cornice work on the Methodist church at Darlington, S. C.

H. WEISS & Co., 20 Cliff street, New York, have been appointed Eastern agents for the O. K. Cornice Brakes, which they are carrying in stock and have on exhibition in their sample room. The Brakes are made of Bessemer steel and weigh much less than the cast iron Brakes. They are said to be much lower in cost and the claim is made that they do equally good work with the heavier goods. This Brake enables many shops to possess a machine of this character where the weight and price of goods in general use have interfered with the possession of this excellent feature of a sheet metal working shop equipment.

THE AMERICAN CAN COMPANY have awarded the contract for an addition to their R. Tynes-Smith Can Factory at Baltimore, Md. They will also install new machinery for increasing the capacity of the plant.

THE NEW ENGLAND STEEL ROOFING COMPANY, Worcester, Mass., announce their removal to fine new quarters in the Spy Building, at No. 274 Main street, that city, where they will have commodious offices. The company are very busy with a large number of important contracts, including new buildings in Rumford Falls and Waterville, Maine, and many in Worcester and vicinity.

A REPORT was current lately in the trade to the effect that the American Can Company proposed the erection of Tin Plate works of their own. This rumor, however, was not given credence in well informed circles, as the close alliance between the Can Company and the United States Corporation would seem to preclude any action that would be detrimental to such relations. It is far more likely that the Can Company will eventually be absorbed by the Steel Corporation, although it is denied that any action in that direction has yet been taken. The American Can Company are customers of the American Tin Plate Company, one of the constituent companies of the Steel Corporation, to the extent of about 50 per cent. of the entire product of Tin Plates. It would seem, therefore, that the interests of the two concerns are largely identical, especially as many of the stockholders and directors are interested in both of the corporations referred to. It is quite safe to assume that no steps looking to the erection of an independent Tin Plate works will be taken by the Can Company.

THE FRED. J. SWAINE COMPANY, of St. Louis, Mo., manufacturers of Dies and Sheet Metal Working Machinery, have a large number of orders in hand for all kinds of Dies and Presses, and their facilities are taxed to the utmost to keep abreast of their business.

CUMMINGS BROS., Holyoke, Mass., have slated the new St. James' Church at Brightwood and also a building for the Merrick Lumber Company of Holyoke. They are now at work relaying the roof on the foundry of the Holyoke Machine Company, and are roofing the addition to the plant of the Holyoke Steam Boiler Works. The firm have just completed contracts for the Dalton Power Company in Fitzdale, Vt., and the Lynch Bros. Brick Company in Holyoke, and have a number of other local roofing jobs in hand.

A SHIPMENT of their Rubber Roof Cement has been made to South America by George Callahan & Co., 218 Front street, New York. The firm report that their sales of this cement are increasing. One of the features is that it can be applied to a wet roof in a rain storm, at the very time that a leak is most difficult to repair and when it is most needed. An important advantage claimed for the Cement is that even when the package is left without its cover the Cement does not get hard, but will stay soft in the package for years. On the roof it remains elastic and is said not to crack or peel, while it sticks tightly to tin, slate, glass, wood or brick, and can be used in corners around chimneys, skylights, flashings, gutters, &c. Those who wish to test the Cement will receive a sample on application. In addition to this specialty the house also carry an Elastic Paint Oil prepared to meet the requirements of roofers; also Soldering Fluid for shop use. This Soldering Fluid is said to leave no stain and to have no disagreeable fumes in use.

THE MANKATO MFG. COMPANY, Mankato, Minn., are adding to their business the manufacture of Boilers, Smoke Stacks and all kinds of Sheet Iron Work, and have secured the services of Ed. Hill, lately connected with the Mankato Steam Boiler Works.

THE report that the American Tin Plate Company would very much enlarge their Johnstown Works, at Johnstown, Pa., is untrue. Nothing has been decided upon in reference to the Johnstown plant.

E. ERIKSON, consulting engineer, Pittsburgh, has a large amount of work on hand. He is building for the Ashland Sheet Mill Company, Ashland, Ky., a continuous billet heating furnace with gas producers and having a capacity of 130 tons of 4 x 8 inch billets every 24 hours. Billets will be heated in this furnace for the three-high Sheet Bar mill which the Ashland Sheet Steel Company are erecting in connection with a four-mill Sheet plant. Mr. Erikson is also building for the Tuscora Steel Company, at New Comerstown, Ohio, four-sheet and pair furnaces and four-annealing furnaces. The latter will be in two pairs, with a gas producer for each pair. The Tuscora Steel Company are erecting a four-mill Sheet plant.

THE LAUGHLIN NAIL COMPANY of Wheeling, W. Va., who have had a six-mill Sheet plant under erection at Martin's Ferry, Ohio, for some months, expect to start up two of the mills this month and two more in a short time. The fifth and sixth mills will not be ready for operation for several months. The Laughlin Nail Company will manufacture Corrugated Roofing and Siding and Stamped Ceiling, and will also make Black and Galvanized Sheets of the best grades.

THE FERRICUP METAL COMPANY, Providence, R. I., manufacturers of Copper or Brass Coated Steel Sheets, Copper Wire, Bars and Sheets, &c., will build a new mill, the details of which are not yet complete.

GEROCK BROS. MFG. COMPANY, 1252 Manchester avenue, St. Louis, Mo., are calling especial attention to their original and attractive designs of Capitals made of Sheet Metal. The concern are also large makers of a varied line of Zinc and Copper Ornaments, also Skylights, Ventilators and Steel Ceilings. They issue a catalogue which they are pleased to send to all who apply.

A Clothes Line Holder.

A holder for a reel of clothes line, the handiwork of an apprentice, and in use in the store of Lane & Lane, Middletown, Conn., is illustrated herewith.

The holder is made of two brackets, each of which is composed of two pieces of $\frac{3}{4}$ -inch galvanized pipe bent, as shown in the illustration. These two pieces are joined together in a cross. To the other ends of these pieces of pipe are screwed flanges. The brackets are then securely screwed to the side wall at the proper distance apart. A reel of clothes line is placed between the brackets, and a gas pipe run through one cross, through the reel and through the other cross, making an axle on which the reel can revolve, having its bearings in the cross overs. Both ends of the gas pipe should be

A Clothes Line Holder.

threaded, and a cap or a lock nut screwed on so that the pipe will stay in place. This makes a very convenient method of holding a clothes line reel.

Lead Coating Cast Iron.

The process in common use for producing a coating of lead enamel on articles made in cast iron is to sift the powdered salt of lead, employed as a glaze, by hand onto the cast iron to which it is to be applied, which must have been previously heated to bright redness. This plan, which gives excellent results, is fraught with serious consequences to the health of the workmen, and in spite of the use by them of respirators and nose guards it speedily brings on ailments of a most distressing character, caused by the inhalation of the fine particles of lead floating in the atmosphere of the workshops. The consequent lead poisoning is not alone due to respiration, but the dust also enters the pores of the skin, and in a few years the bulk of the work people engaged in this industry succumb to the ravages of this terrible poison. An account is given by Georges Caye in *La Nature* of a process for applying a coating of lead enamel to iron surfaces by mechanical means, invented by A. Dormoy, the manager of the works at Sougland, in the Department of Aisne, France, in which danger of injury to the health of the work people is avoided. The articles to be coated, after being heated to redness, are placed in a double hermetically sealed chamber with glazed sides; each half of the chamber can be worked alternately, and the surplus enamel powder, dusted over the metal by means of a sieve, is removed from the chamber by the draft from a high chimney. The necessary movements of the iron can be effected from the outside of the chamber, and the vibration of the sieves for the purpose of distributing the lead powder is provided for by an electrical beater. The various methods of introducing and rotating the object to be enameled, operated from the exterior of the chamber, are fully described, and it is stated that the new process has proved extremely successful in working and entirely does away with all risk of ill effects to the work people engaged.

THE LETTER BOX.

Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.

Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.

WILL WIND MILL PUMP RAISE THE WATER?

From G. S. D., Summerside, P. E. I.—I would like to ask for information through the columns of *The Metal Worker* in reference to securing water under the conditions presented in the sketch herewith. We desire to use water in the cellar of a building which is 1658 feet distant from a river and 100 feet above it. It will be noticed that the ground is practically level for the first

Will Wind Mill Pump Raise the Water?

135 feet from A to B, and from B to D—1423 feet distant—the ground slopes down 100 feet. Can the water be raised by means of a wind mill placed at the house? If so, what sized pipe would be best to run from the river to the wind mill pump? The wind mill runs other machinery.

Answer.—You cannot pump water directly to the height named with the pump at the location of the wind mill. We suggest that the cheapest way is to transmit the power of the mill by means of a wire rope over large sheaves from the mill shaft to a pump shaft located near the river bank, so arranged that the pump barrel will be no more than 15 feet above the water in the river. Another system for pumping water from a distant location is by the use of compressed air, in which a small air compressor may be operated by the wind mill and the compressed air conveyed to an automatic water chamber in a well or the river by a pipe line, with a pressure sufficient to drive the water to a tank at the desired elevation and distance. The water pipe should be $1\frac{1}{4}$ inches. There are possibilities that a small wind mill over a well at the river bank will give more satisfactory results with less care and expense than any of the more complicated systems of pumping and conveying water.

DOES ASPHALT CEMENT CAUSE RUST?

From J. F. R., Big Rapids, Mich.—Can *The Metal Worker* or some of its readers tell me what it is in asphalt cement which causes tin and iron roofing to rust? There is one firm of roofers who come here every year or so and smear all the roofs within their reach with some of their cement. After they are gone a short time we have a great time looking for leaks. We would also like to know what is the best covering for tin and iron roofs.

Note.—We shall leave this question to our roofing readers and hope that they will give any experience they have bearing upon the subject. There are a number of good roofing paints which, if applied to the tin and iron roofs before they have time to start to rust, and then protected by other coats until the surface is entirely covered, are well calculated to make tin or iron roofing durable.

NAME AND ADDRESS WANTED.

Will the correspondent signing himself "Constant Reader," who sends an inquiry in regard to soldering aluminum, please furnish his name and address, in accordance with the conditions printed at the head of this department?

PIPING FOR HOT WATER HEATING.

From B. C. C., Illinois.—This being the time of the year in which a great many tradesmen are engaged in putting up hot water heating systems, it occurs to me that the discussion of the merits of the one and two pipe systems would not only be timely, but would greatly benefit the trade by spreading information in regard to work of this character. It would add interest to any information on this head that might be presented if the following points were covered:

Sizes of pipe to be used;

Methods for determining the size of pipe;

Arrangement of piping in running mains;

Arrangement of piping in taking off branches;

Arrangement of piping in connecting radiators;

Arrangement of piping in connecting expansion tank;

Methods for determining the size of radiators.

These are the important details and a comparison of the way such work is done could not fail to give new ideas and information that would be profitable to all who are actively interested in the question. I would therefore ask *The Metal Worker* to invite its readers to participate in such a discussion of their every day work and practice. It would surely enable some of them to avoid and correct errors that might interfere with the success of their work or involve them in losses.

Note.—The questions presented by this correspondent are of general interest, and many of our readers can give valuable information bearing on them. This department of *The Metal Worker* is provided for the exchange of information by our readers and we shall be glad to have each of these questions treated fully for the benefit of the trade. In the meantime we refer our correspondent to an article bearing on this subject presented on another page.

OIL FUEL BURNERS.

From Thomas F. Brady, Berkeley, Cal.—In reply to the inquiry of "J. P. B.," in *The Metal Worker* of October 12, I would state that there are fuel gas burners on the market for cook stoves. The accompanying illustration shows a burner in a cook stove adapted for burning oil, in which A is a cast iron pear shaped bowl, perforated at the top for the escape of the gas generated from the oil. B represents asbestos rope wrapped around a $\frac{3}{8}$ -inch pipe in the chamber just under this bowl and

Oil Fuel Burners.

connected with it. Small holes are drilled in the $\frac{3}{8}$ -inch pipe, so that the oil can flow on the asbestos, the heat in the upper bowl being sufficient to vaporize the oil into a gas, which is burned at the orifices in the casting A. D is a $\frac{3}{8}$ -inch valve on the supply pipe at the stove, and E is another valve at the oil tank, which can be placed outside the house proper for safety; but it should be high enough to be above the stove, so that the oil will naturally flow from the tank to the generating chamber. G represents the plate to be set in the fire chamber in place of the coal grate and under the burner. The pipe can be brought from the oil tank under the floor and either up through the bottom of the stove or through the side of it, as may be most convenient or

desirable. The plate G is also shown upside down, with flange extending from it. This plate should be placed in the stove in such a position that in operation the burner will rest upon it and be at a hight to afford a good Bunson flame, but not so high that it will deposit soot on the underside of the top and the covers. All of the ordinary openings in the front of the stove should be cemented air tight, so that all the air which enters will come up through the opening in the plate G. This will produce a better flame than if the air is allowed to enter the fire box from all points freely. Care should be taken about this. It may be necessary to experiment in raising and lowering the burner until a good flame is secured and the right hight determined. The draft from the stove pipe will carry off the odor from the oil and the stove will do all the ordinary work of cooking. This burner is handled in this section with success, and "J. P. B." can secure full particulars if he cares to correspond with me.

CONSTRUCTING A CHURCH FURNACE.

From A. S., Fort Recovery, Ohio.—I ask the assistance of the readers of *The Metal Worker* on heating a church, for which I have constructed a home made furnace. I desire to know, if it will work, how I can get the best results. The room to be heated is 30 x 50 feet, with an arched ceiling averaging 14 feet in height. In one corner of the room a space about 4 feet square is used for a vestibule. I have a 50-inch heavy cast iron box stove with grate for burning wood, and I wish to set it in a brick chamber, leaving 9 inches of space all around it. The smoke pipe is 8 inches at the collar, but must be divided into two 6-inch pipes and be con-

Constructing a Church Furnace.

nected with two flues, as the flues are so small that larger than a 6-inch pipe cannot be connected with them, and one would not be sufficient to carry off the smoke. I desire to locate the furnace at the end near the flues, then run the hot air pipes to the registers, so located that they will give the best results. Could I place the furnace 12 or 15 feet out from the flue and put in one large register, or place two—one in each aisle? The basement is where the furnace is to be set, and as it must be used for a Sunday school room and must be heated from the furnace, it is desired to have the furnace occupy as little space as possible in the Sunday school room. I shall be pleased to have some assistance in locating the furnace and the registers and arranging for the cold air supply. The building has a stone basement with brick walls above.

SHOP RULES.

From A. G., Tacoma, Wash.—I should be glad if some of the readers of *The Metal Worker* would send in for publication the rules adopted by them for governing employees in a shop principally engaged in tinsmithing and plumbing work; also their methods for keeping an

account of the time and of the work done and material used daily by each workman.

Note.—In *The Metal Worker* of August 24 our correspondent will find the method of keeping account of the time and material used in the shop of one of our contributors. So far as shop rules for the government of employees are concerned, we shall be glad to present those that our friends have found useful.

The Griswold Proposed Metric Wire Gauge.

The accompanying sketch shows a wire gauge proposed by M. W. Griswold of New York. The center division represents 1-360th part of a circle, and has one of its sides divided to represent millimeters and the other marked with the gauge numbers. Commencing with the center of the circle as No. 0, each number increases re-

Sketch of the Griswold Metric Wire Gauge.

spectively 1 millimeter as roughly drawn. This division, beginning with No. 0, ends with No. 15. The marginal slots extend from No. 5 to 24. The former is intended to illustrate the principle upon which the gauge depends, and the latter the most practical form of manufacturing it.

Illinois Retail Hardware Dealers' Association Label.

The Illinois Retail Hardware Dealers' Association furnish to their members blue labels, of which the illustration herewith is a reproduction. The purpose of it is for attachment to every communication sent to a

manufacturer or jobber, so that the daily mail may show a material increase of labels from time to time, and that any person doing business with the retail Hardware trade may know that this association is here permanently and flourishing.

TRADE REPORT.

MARKET SUMMARY.

Pig Tin is quiet, and without change in price.
Copper remains firm and dull.
Pig Lead is unchanged.
Spelter is scarce and firm.
Hallett's Antimony is a shade lower in price.
Nickel continues firm.
Aluminum is active and unchanged.
Tin Plates are without change.
Sheets are still in good demand, and prices high for spot.
Old Metals are unchanged in price, with irregular demand.
Sheet Copper is active and firm.
Sheet Zinc is in moderate demand at former prices.
Foundry Iron is active and prices strong, with higher tendency.
Hardware is in excellent demand, and prices are well maintained.
Plumbers' Supplies are very active, and prices strong in all lines.
Building and Roofing Papers have been advanced in price.
Manila Rope is up 1c. a lb.
Wire Nail prices show some irregularity; demand is good.
Cut Nails are in fair demand, and unchanged in price.
Wire remains active and firm.
Window Glass prices vary in different places, jobbers making their own quotations.
Linseed Oil is scarce, and unchanged in price.
Spirits Turpentine is quiet and firm.

METAL MARKET.

NEW YORK, November 1, 1901.

Pig Tin.—The conditions in the Pig Tin market remain practically unchanged from last week. Business is quiet, the demand for spot metal being particularly slack. Prices have not changed much during the past week; in short, the market has possessed but little interest. Straits Pig in small lots is quoted at 25½c. to 26c. per lb. A shipment of 25 tons of Tin from this market to Genoa was made during the week. This transaction was made possible by the fact that our market for spot Tin was slightly below London's spot figures and that freight rates from here to Europe are extremely low at this time. The market at the close was firm but very dull.

Copper.—Sensational rumors continue to circulate with reference to Copper, their rapidity being equaled only by the promptness of denials as to their truth. In the meantime consumers show an increased disposition to postpone all but absolutely necessary purchases, and the total of such purchases at this time is quite small. This is especially the case as regards Lake Copper. The rumors above referred to emanate from Wall street and are circulated to affect the fluctuations of Copper stocks. That a reduction in the price of Copper will be made is firmly believed by many in the trade, but it is not looked for just yet. In Lake Copper business is practically at a standstill. The production for the balance of this year is all contracted for, and such metal as is now changing hands is only for retail account. Prices are without change, Lake Ingot in small lots being quoted at 17¼c. to 17½c.

Sheet Copper.—Manufacturers of Sheet Copper report the continuance of a very active demand for this

material from all quarters. The consumption of Sheet Copper this season appears to be considerably ahead of that of former years. A great deal of the material is being used for cornice and architectural work, and also by stamping companies. Prices are very firm. Sheet Copper from store being quoted on the basis of 21c. per lb.

Pig Lead.—There is no change in the situation in this metal. Business is dull and prices are unchanged. American Pig in small lots is quoted at 4.62½c. to 4¾c. per lb. St. Louis advices indicate a favorable demand for Pig Lead in that market, with a marked steadiness in prices.

Spelter.—Spot Spelter here is scarce, and prices are quite firm, good Western brands in small lots being quoted at 4.55c. to 4.60c. per lb. The demand is of fair proportions, and the market as a whole has a strong appearance. The European Convention of Producers, which was expected to regulate production and prices abroad, failed to do so, as the Silesian producers refused to join in the movement.

Sheet Zinc.—No change has occurred in the market for this material. Jobbers are quoting 600-lb. cask lots at 6¾c. per lb. and smaller quantities at 7c.

Antimony.—Hallett's Antimony has declined a trifle, and it is now quoted in small lots at 8½c. to 9c. per lb. Cookson's is unchanged, being held at 10½c. to 11c. in small lots. The demand is of ordinary proportions.

Nickel.—No change has occurred in this metal. Small lots are quoted at 60c. to 65c. per lb.

Aluminum.—An active demand for Aluminum continues, and prices remain at 37c. per lb. for small lots of No. 1 Ingot guaranteed 99 per cent. pure, and 35c. for 100-lb. lots.

Tin Plates.—There is nothing new to report in connection with the Tin Plate market. The American Tin Plate Company are booking orders for the first quarter of 1902 at present prices, and it is understood that a good volume of business for future delivery is being placed. The demand for spot Plates is confined to small lots for present use. Jobbers in this section still complain of backwardness in receipts of supplies of Plates. Especially is this the case with Bright Charcoal and Terne Plates. The company are apparently putting almost all their force into the production of Coke Tins. However, there is no longer the extreme stringency that there was a few weeks ago, and jobbers' prices have lost a good deal of their stiffness. There is still a considerable irregularity in spot prices named by the jobbers, and quotations must, therefore, be taken as largely nominal. American Bessemer Coke Plates, 1C, 14 x 20, in moderate sized lots delivered at New York or corresponding points, now rule at about \$6.50 to \$6.75 per box. A further slight decline in the price of Welsh Plates has occurred during the week.

Sheets.—The demand for Sheets, while not quite so pressing as it was earlier in the season, still continues on a large scale, and the mills have all the business that they can take care of. Deliveries are still greatly delayed and jobbers in this vicinity complain of the difficulty of obtaining sufficient stocks to satisfy the current needs of their customers. The mills have a large number of back orders on their books, with which it will take them several months to catch up. The market meanwhile is settling down to a more normal condition, and there is no longer such a wide range of prices on Sheets as prevailed during the strike and immediately following it. The independent mills are adhering pretty closely to the quotations made by the leading interest. Jobbers' prices, however, are still materially higher than the official mill quotations. No. 27 One Pass Cold Rolled Soft Steel Sheets are quoted

at about 4.10c. to 4.15c., and Galvanized at 60 and 10 per cent. to 65 per cent. off the list.

Chicago advices are as follows: The Sheet supply improves slowly. Some jobbers are now receiving fairly good shipments from mill, but the rule is for stocks to continue broken. The demand is above the supply and values from store recede with great deliberation. No. 27 Common is quoted at 3.75c. to 3.85c. by the more fortunate possessors of stock. Galvanized is slightly lower, 65 and 10 being a common quotation. The scarcity in Tin Plates continues, Terne Plates becoming easier.

Old Metals.—The market for Old Metals is rather irregular. A good demand is noted for some kinds of Scrap Iron, while Scrap Copper and Brass are moving more freely in some quarters. There is no real snap to the market, however. Prices show no quotable change. Dealers are paying about the following rates for moderate sized lots, delivered at New York or corresponding points:

Heavy Copper.....	per lb. 14½c.
Light and Tinned Copper.....	per lb. 12¾c.
Heavy Brass.....	per lb. 9¼c.
Light Brass.....	per lb. 7½c.
Lead.....	per lb. 4 c.
Tea Lead.....	per lb. 3½c.
Zinc.....	per lb. 2¾c.
No. 1 Pewter.....	per lb. 17½c.
No. 2 Pewter.....	per lb. 8½c.
Tin Plate Scrap, per gross ton.....	\$6.50 to \$7.00
Wrought Iron Scrap, per gross ton.....	10.50 to 11.00
Heavy Cast Scrap, per gross ton.....	10.25 to 10.50
Stove Plate Scrap, per gross ton.....	7.25 to 7.50
Burnt Iron, per gross ton.....	5.00 to 5.50

THE PIG IRON MARKET.

NEW YORK.—The market is steady, but without any special activity. The Pipe industry has taken additional quantities lately. We quote: Lehigh, Schuylkill and Virginia Irons, No. 1, \$16 to \$17.50; No. 2 X, \$15 to \$15.75; No. 2 Plain, \$14.25 to \$14.50; Tennessee and Alabama brands, No. 1 Foundry, \$15.50 to \$15.75; No. 2 Foundry, \$14.75 to \$15; No. 1 Soft, \$15.50 to \$15.75; No. 2 Soft, \$14.75 to \$15; No. 3 Foundry, \$13.75 to \$14; No. 4 Foundry, \$13.50 to \$13.75.

CHICAGO.—The market for Pig Iron, while slightly less active than last week, remains more than fairly brisk. The business of the week has been well distributed. Some of the local furnaces are now sold so far ahead that they will soon be out of the market for delivery during the first part of 1902. Prices are steady, as follows:

Lake Superior Charcoal.....	\$17.00 to \$18.00
Local Coke Foundry, No. 1.....	15.25 to 16.00
Local Coke Foundry, No. 2.....	14.75 to 15.25
Local Coke Foundry, No. 3.....	14.25 to 14.75
Local Scotch, No. 1.....	15.25 to 16.00
Ohio Strong Softeners, No. 1.....	17.00 to 17.50
Southern Silvery, according to Silicon.....	15.65 to 16.00
Southern Coke, No. 1.....	15.15 to 15.40
Southern Coke, No. 2.....	14.40 to 14.65
Southern Coke, No. 3.....	13.90 to 14.15
Southern Coke, No. 1 Soft.....	15.15 to 15.40
Southern Coke, No. 2 Soft.....	14.40 to 14.65

PHILADELPHIA.—Business continues on a surprisingly large scale, considering that the closing month of the year is near at hand. The situation appears to be much stronger than the most pronounced optimists would have predicted three months ago. Sales during the past week have included almost every grade of Iron that is made. Small lots of the best qualities have sold at very full prices, while at the inside figures very little has been done, the great bulk having been at medium or a little better than medium prices, particularly when quick deliveries are specified. The general range of the market may be quoted about as follows, for Philadelphia and nearby points, and 25c. to 50c. less for deliveries within a radius of 100 miles south or west: No. 1 X Foundry, \$15.50 to \$16; No. 2 X Foundry, \$15 to \$15.50; No. 2 Plain, \$14.60 to \$14.75.

PITTSBURGH.—Pig Iron is the strongest department of the whole Iron trade, and it is estimated that the entire stocks of the country do not represent a ten days' supply. Bessemer Iron is very strong, and a good deal is changing hands. Foundry Iron is extremely active, and there have been heavy sales for deliveries running through the first part of next year. Buying is general, and small foundries that usually take only a few tons at a time are placing orders for 300 to 500 ton lots. It is

estimated that from 40,000 to 50,000 tons of Foundry Iron have been sold for delivery in this district in the next six to eight months. Prices have advanced sharply, and No. 2 Foundry is \$15 minimum, with sales reported as high as \$15.25 to \$15.50. No. 1 Foundry Iron is quoted at \$15.50 to \$16, Pittsburgh.

CINCINNATI.—There has been a continuation of the same conditions that have prevailed in the Iron market throughout the entire month. Trade has been good, and many furnaces are pretty well sold up for the first quarter of next year. Stock for prompt shipment is exceedingly scarce. There has been no change in prices, and little disposition is shown to advance from the present basis. Quotations in the main are steady on the same basis as a week ago. The outlook is for a good, steady market. We quote, f.o.b. Cincinnati, as follows:

Southern Coke, No. 1.....	to \$14.25
Southern Coke, No. 2.....	to 13.75
Southern Coke, No. 3.....	to 13.25
Southern Coke, No. 4.....	to 12.75
Southern Coke, No. 1 Soft.....	to 14.25
Southern Coke, No. 2 Soft.....	to 13.75
Southern Coke, Gray Forge.....	to 12.75
Southern Coke, Mottled.....	to 12.75
Ohio Silvery, No. 1.....	\$15.10 to 15.60
Ohio Silvery, No. 2.....	14.60 to 15.10
Lake Superior Coke, No. 1.....	15.10 to 15.60
Lake Superior Coke, No. 2.....	14.60 to 15.35
Lake Superior Coke, No. 3.....	14.10 to 14.85

ST. LOUIS.—There is no noticeable change in the heavy and urgent requirements in the Pig Iron market, and several furnaces are reported to be sold right up for the first half of 1902 on certain grades. The transportation problem seems to be causing increasing uneasiness, and it is difficult to make shipments anywhere near on time. We quote as follows for cash, f.o.b. St. Louis:

Southern, No. 1 Foundry.....	\$14.75 to \$15.00
Southern, No. 1 Foundry.....	14.00 to 14.25
Southern, No. 3 Foundry.....	13.50 to 13.75
Southern, No. 4 Foundry.....	13.00 to 13.25
No. 1 Soft.....	14.50 to 14.75
No. 2 Soft.....	14.00 to 14.50

THE HARDWARE TRADE.

There is little reason for complaint in regard to the volume of business. The time of year has come when stocks are normally in good shape and attention is being given to the marketing of goods by merchants, both wholesale and retail. All the reports indicate that in both these branches of trade there is an excellent demand. It is the season when retail business is usually active and goods in considerable variety are being disposed of. In the line of builders' hardware there continues to be a demand which in several lines takes up the products of the factories as fast as the goods are turned out, and a good deal of inconvenience is occasioned by the delay in executing orders. Season goods also are moving steadily and in large quantities, with the result of making something of a scarcity in some kinds. Holiday trade is receiving attention, as enterprising merchants are getting ready for it and preparing to avail themselves of the opportunity which the season presents. Some lines which have been in short supply and on which the manufacturers have been far behind their orders are giving less cause for complaint and are being turned out by the mills more promptly. This is the case with barbed wire, wrought iron pipe, tin plate, sheets, and other heavy lines.

The tone of the market is on the whole excellent. Prices as a rule are steady and well maintained, but there are some soft spots. Wire nails, while regular quotations continue unchanged, are being cut to a certain extent, owing to the entrance into the market of outside competition. On the other hand, the general tone of the market is decidedly good. Some lines have been slightly advanced of late, and in many others in which no change has been made the cost of the raw material and advances in wages are adding to the cost of the goods. Conservative manufacturers are, however, reluctant to make advances and are satisfied at present to hold more firmly to their established prices, and are less anxious to contract for future deliveries.

S. E. JOHNSTON and James Maxwell have entered into partnership in the plumbing business on Stevens-street, Spokane, Wash.

NOTES ON PRICES.

Plumbers' Supplies.—Jobbing houses report an active demand for Plumbers' and Steam Fitters' Supplies, covering almost everything in this line. A large amount of new and repair work is in hand in and near New York City, which calls for a considerable volume of Plumbing Goods. The only complaint made by jobbers is of the continued scarcity of some kinds of supplies, especially Sanitary Enameled Ware and heating sizes of Wrought Iron Pipe. This scarcity, however, is not so pronounced as it was a few weeks back, as consumers' demands have been largely satisfied, and the goods are coming in with greater freedom. Prices are well maintained all along the line of Plumbers' and Steam Fitters' Supplies, with no indication of weakening in any direction.

Building and Roofing Papers.—Manufacturers of Building and Roofing Papers report some recent advances in price, despite the active competition, of which there are some indications in both Tarred and Rosin Sized Papers, as well as that of Asbestos material. Tarred Felt, single ply, is quoted at \$26 to \$28 per ton. Two-ply Felt is offered at 45 cents per roll, and three-ply at 65 cents per roll, of 108 square feet each, quite generally; while small lots to the average buyer are 50 and 75 cents, respectively. There is also a disposition to harden the price for Rosin Sized Sheathing, this market having been affected in a measure by the burning down last month of one of the four principal factories, followed by a conference of the remaining concerns at which it was decided to advance prices somewhat. The price to the average buyer now is about \$28 per ton. Manufacturers and dealers both refer to the difficulty of executing or getting orders filled, and further advances are predicted for next month. Deadening Felt is quoted variously at \$35 to \$37 per ton, this material regularly advancing in the fall and receding in the spring. Asbestos Building Felt and Mill Board 1-16 inch thick and less is being sold as low as 2½ cents per pound. Mill Board thicker than 1-16 inch and Sheets, 40 x 40 inches, 3½ cents per pound.

Cordage.—Owing to a sudden advance in the price of Manila Hemp, the price of Manila Rope was advanced 1 cent per pound by manufacturers on the 28th ult.

Wire Cloth.—The prices for Wire Cloth for the coming season have not yet been determined by the manufacturers, but it is anticipated that the question will be settled in the near future.

Enameled Ware.—Under date of November 1, 1901, the Lalance & Grosjean Mfg. Company, 19 and 21 Cliff street, New York, have issued a new and revised price-list of their Enameled Wares, superseding all former lists. The new prices are subject to discounts on the company's several lines of Enameled Ware, as follows:

	Discount.
Agate Nickel Steel Ware.....	50 and 20 %
Pearl Agate Ware.....	50 and 20 %
Blue and White Ware.....	60 and 15 %
All White Ware.....	50 and 20 %
Regal Steel Ware.....	60 and 10 %
Peerless Ware.....	70 and 10 %

Terms 60 days, or 2 per cent. for cash in 10 days.

The new prices and discounts adopted by the Lalance & Grosjean Mfg. Company are uniform with those of the National Enameling & Stamping Company.

Wire Nails.—Wire Nails are moving in satisfactory volume in the New York market. The retail merchants are ordering in small lots for the most part. As a result of the efforts made by new manufacturing concerns to secure business by offering Nails at lower prices than the regular quotations, local prices have been affected. Small lots of Wire Nails at store are now being sold at \$2.50 to \$2.55 per keg.

Cut Nails.—Manufacturers of Cut Nails, owing to their inability to obtain Steel, are still in arrears, some of the mills being from 15 to 30 days behind on orders. New York stocks of Steel Cut Nails continue to be somewhat broken in assortment, owing to the scarcity of some sizes. There is little difficulty in obtaining Iron

Cut Nails, but, while these are preferred in some sections, they are not always regarded with favor by the trade at large. Cut Nails from store are quoted at \$2.18 to \$2.30 per keg.

Wire.—The demand for Plain Wire keeps up and the output of the mills is shipped as fast as made. It is said that prices on Plain Wire are shaded only for desirable orders and for certain points of shipment in competitive territory. Plain Wire in small lots in New York is quoted at 2.60 cents, and Galvanized at 3 cents.

Window Glass.—At a recent meeting of the National Window Glass Jobbers' Association a resolution was passed permitting jobbers of the various large cities to establish such prices in their districts as they think will be for the best interest of the American trade. For the present, instead of a uniform price being adhered to in the different districts covered by the Jobbers' Association, the local jobbers in various cities will make their own prices. It is understood that a change in price, covering the whole list or a single bracket, may be made. The impression prevails that the market is not in as desirable a condition as reports would indicate. Manufacturers have more Glass on hand than they expected to have at this time, and the same is true of many jobbers. In fact, the demand has not been nearly as large as was anticipated. Glass is so high in price that stocks are being cut up to sizes by the trade, rather than order any more. No change has been made in local quotations, which are 80 and 20 per cent. discount on less than car lots from store.

White Lead.—White Lead in Oil still continues in good fall demand; in fact, the trade in this line has been very satisfactory since the cooler weather set in. Prices continue somewhat irregular, varying according to the manufacturer and the size of the order. There is a report in circulation that later a reduction in price is contemplated of ¼ cent per pound. The report, however, is without official confirmation. White Lead in Oil is quoted in a retail way at 7 to 7¼ cents per pound.

Linseed Oil.—The general condition of the Linseed Oil market is unchanged. Spot Oil continues scarce, and crushers are only shipping small lots on October contracts. There is not much prospect of the situation improving until the crushers can buy Seed more freely, and the demand falls off on the advent of cold weather. City Raw Oil is quoted in moderate sized lots at 66 to 67 cents per gallon. Bolled Oil is 2 cents advance on Raw.

Spirits Turpentine.—The Turpentine market has fluctuated but little, and quotations are now the same as a week ago. Local stocks are not large, and receipts at Southern points are not heavy. Business is comparatively light and confined to small lots. Retail quotations are 39 to 39½ cents per gallon.

Old Rubber.—The demand for Scrap Rubber is moderate. Prices are strong. Dealers in New York and Vicinity are paying about the following figures:

Car Springs, ton lots, per lb.....	5¼c.
Rubber Shoes, less than carloads, per lb.....	7¼c.
White Wringer Rolls, per lb.....	7¼c.
Inside Bicycle Tubing, per lb.....	21½c.
Outside Tubing, per lb.....	7¼c.

TRADE NOTES.

GEORGE C. FISKE, Hinsdale, N. H., is interested in the formation of a company who propose to manufacture a new metal, to be used in many instances as a substitute for Brass. It is proposed to erect a factory for the purpose.

THE ALABAMA MFG. COMPANY of Birmingham, Ala., of whom Samuel D. Jones is the head, have leased 80 convicts from the State of Alabama and propose to utilize them in their Iron Hollow Ware plant now being built at North Birmingham.

THE NEW YORK ALUMINUM COMPANY, 142-144 Worth street, New York, advise us that they have bought the stock, factory and wareroom of Raymond & Gottlob, formerly at 831 Broadway and 109 Fulton street. While the management of the Aluminum Company is entirely new, arrangements have been made to retain the serv-

ices of all the experienced employees of the old firm, so that with a greatly enlarged and improved plant and increased facilities the company are in a better position to supply the trade with all goods in the Aluminum line. Their specialty will be spinning, casting and stamping of Aluminum articles of all kinds.

Oil in Wyoming.

In a recent report on the oil lands of Wyoming Professor Knight, the State geologist, says: "Oil of superior quality has been known to exist in the fossil district for many years; there are seven distinct springs that flow oil, and a dozen years ago there were drilled in this field with a crude rig three wells, all yielding oil, and from which several hundred barrels of oil flowed; the deepest was but 200 feet. Owing to inexperience these wells were allowed to cave in at the bottom and ceased to flow. One, however, has continued to flow a small amount of oil to the present time. The evidences of an extensive oil field are on every hand. Gas is constantly escaping from the springs and from one old well. There are thousands of tons of oil shales in the field that contain enough oil to burn. It is a matter of history that Wyoming is rich in oil of a high grade. At Lander, in Fremont County, more than a dozen years ago, Dr. Graff of Omaha drilled three wells. They were all gushers. The remoteness from a railroad has made it impracticable to use this product. The wells still flow, and it is estimated that more than 60,000 barrels have flowed from them. In one reservoir there is at this time over 15,000 barrels, and the United States report on this field for 1898 and 1899 estimates that 4000 barrels go to waste annually in spite of attempts to shut it off. Nearly every one knows of the well recently drilled by the Union Pacific Railroad Company at Spring Valley. This well was drilled for water and struck oil of a very high grade. There is at this time over 700 feet of oil in this well, but the company will not permit it to be operated. Another well is now drilling within 2 miles of this Union Pacific well, and at 400 feet oil has been struck."

The system of giving premiums to workmen or apprentices for inventions or suggestions connected with their business has been followed by more than one large manufacturing concern in this country as well as in Great Britain, but probably few concerns have taken the course followed by David Thomson & Co., Limited, of Edinburgh, Scotland. This firm have adopted what they have found to be a thoroughly practical and successful method for stimulating apprentices to acquire a technical training and develop their intellectual faculties. The system takes the form of money awards, which are paid to apprentices who pass the examinations of the Science and Art Department in engineering subjects. Last year the firm paid out \$560 in such awards, and this year \$1265 has been paid, the practical outcome being a better quality of production at the works and a marked improvement in the skill of the worker.

The announcement that negotiations have been concluded for the shipment of \$000 tons of Texas petroleum to London is an event of considerable significance. If the experiment proves a success and it is found that the crude oil from Texas can be utilized in England for fuel purposes, this undertaking should mean a remarkable boom for the newly developed oil industry of the Lone Star State. There is a practically unlimited demand for cheap fuel in Great Britain, and also on the European Continent, owing to the high price of coal and its growing scarcity. For some time past European manufacturers have been looking to America for the solution of their problem of how to obtain cheap fuel. If Texas, with her enormous oil resources, succeeds in placing her product in Europe she will find a market that should prove a veritable gold mine.

The steamship "Siberia," of 18,600 tons, one of the largest ships ever built at an American yard, was

launched recently from the yard of the Newport News Shipbuilding & Dry Dock Company, Newport News, Va. The "Siberia," which has been constructed for the Pacific Mail Steamship Company, is 573 feet long and 63 feet beam, with 40 feet depth of hold. The "Korea," a sister vessel, of the same dimensions, was launched from the Newport News yard last March. The two vessels will run between San Francisco and Eastern Asiatic ports.

Sheet Metal Pattern Drafting

A course of instruction by mail for tinsmiths, coppersmiths, plumbers, sheet-iron workers, furnace workers, skylight makers and others that will enable a student to "strike out" working patterns for all kinds of sheet metal work. This is what a student says:

His Course More Than Paid for Itself

I am a tinsmith, and consider your course in Sheet Metal Pattern Drafting one of the best investments I ever made. Before I was half through I had realized from it more than the money paid for the whole course.

M. E. TOBIAS,
63 Fifteenth St.,
Wheeling, W. Va.

We teach by mail Mechanical, Steam, Electrical, Civil and Mining Engineering; Shop and Foundry Practice; Mechanical Drawing; Architecture; Plumbing; Sheet Metal Work; Telephony; Telegraphy; Chemistry; Ornamental Design; Lettering; Book-keeping; Stenography; Teaching; English Branches; Locomotive Running; Electrotherapeutics. When writing state subject in which interested.

taught by mail.

TINSMITHS' HELPER and PATTERN BOOK

WITH USEFUL RULES, DIAGRAMS and TABLES
= By H. K. VosBurgh =
NEW AND IMPROVED EDITION

A USEFUL hand-book for tinner and other mechanics, treating simple problems in pattern cutting, such as are of daily occurrence in the shop. An elementary manual for the young tinsmiths. A handy reference for all sheet metal workers.

120 Pages
53 Figures

An Invaluable \$1.00
Pocket Companion . .

Section 1 ~ Pages 1-66 Diagrams and Patterns

Demonstrates in a simple way, and by means of illustrations and descriptive text, about 50 examples of sheet metal pattern work, such as the method of cutting can breasts, flared tinware, scale scoops, oval boiler covers, lips for measures, elbow patterns, &c.

Section 2 ~ Pages 69-88 Epitome of Mensuration

Compiled with regard to the requirements of the tinner, describing how to find the area of a circle, the circumference of a circle, the contents of a sphere, a cylinder, a cone, and other information relating to the work of a tinsmith.

Section 3 ~ Pages 89-120 Tables, Rules, Recipes

Gives tables of the weights of sheet metals, including the weight of black sheet iron, sheet lead, and galvanized iron sheets with their dimensions; the weight of lead pipe per foot; the weights of tin plates, sheet copper and sheet zinc. Several pages are devoted to tables giving the areas and circumferences of circles; the capacity of cans, the number of barrels in cisterns and tanks, sizes of tinware in form of frustum of a cone, &c., and practical receipts, including mixtures for solders of different kinds, soldering fluxes, and various cements.

Cloth Bound, \$1.00 Postpaid

"BOSS" WASHING MACHINES.

Trade-Mark.

Closed View.

Illustration of the latest improved "BOSS" double action and rub board washing machine. Has all gearing enclosed and other important improvements.

SIZES: { 7, 8, 9, wood frame lower cylinder.
10, 11, 12, steel frame lower cylinder.

We are also the patentees and manufacturers of the following:

The Boss Internal Gear Washer,
" " External " "
" New Boss Rotary " "
" " Champion Rotary " "
" " Standard Champion " "
" Standard Perfection " "
" Banner Washer and
" Improved Standard.

The washers are carried in stock in carload lots in all the principal cities. Write us and we will quote you prices and at same time advise you as to where and from whom you can obtain them from stock, thereby, perhaps, saving extra cost of freight, than when shipping from factory. These washers are carried in stock under jobbers' special brands, but none are genuine without our name and address appearing on each machine. Write for one of our beautifully illustrated and descriptive catalogues, mailed free upon application.

A UNIVERSAL REMEDY FOR LEAKY ROOFS.

The valuable qualities of a good roofing cement are firm adhesiveness and elasticity. These qualities the American Seal Builders' and Roofers' Elastic Oil Cement possesses. It will adhere firmly to Slate or Metal and will not crack or crumble. It is especially recommended for repairing leaks around chimneys, dormer windows, skylights, scuttles, firewalls and any place that requires fixing on a roof, either Slate, Tin or Shingle.

This Cement will answer to repair a roof when Solder cannot be used.

PUT UP In Barrels, about 800 lbs. In Tubs, about 112 lbs. In 25 and 50 lb. Pails. In 5, 10 and 15 lb. Pails.

ART IN METAL CEILINGS

Greek Design.

At the first the Greeks had no distinctive style of design or architecture. They imitated Egyptian and Oriental models, but later on evolved world famous styles of their own.

Such were the Ionic, Doric and Corinthian, which became accepted standards and formed the basis for styles of succeeding periods.

Greek design had great originality, simplicity, regularity and artistic delicacy of treatment.

Our Greek design of

"Classik"
BERGER'S
TRADE MARK
METAL CEILINGS

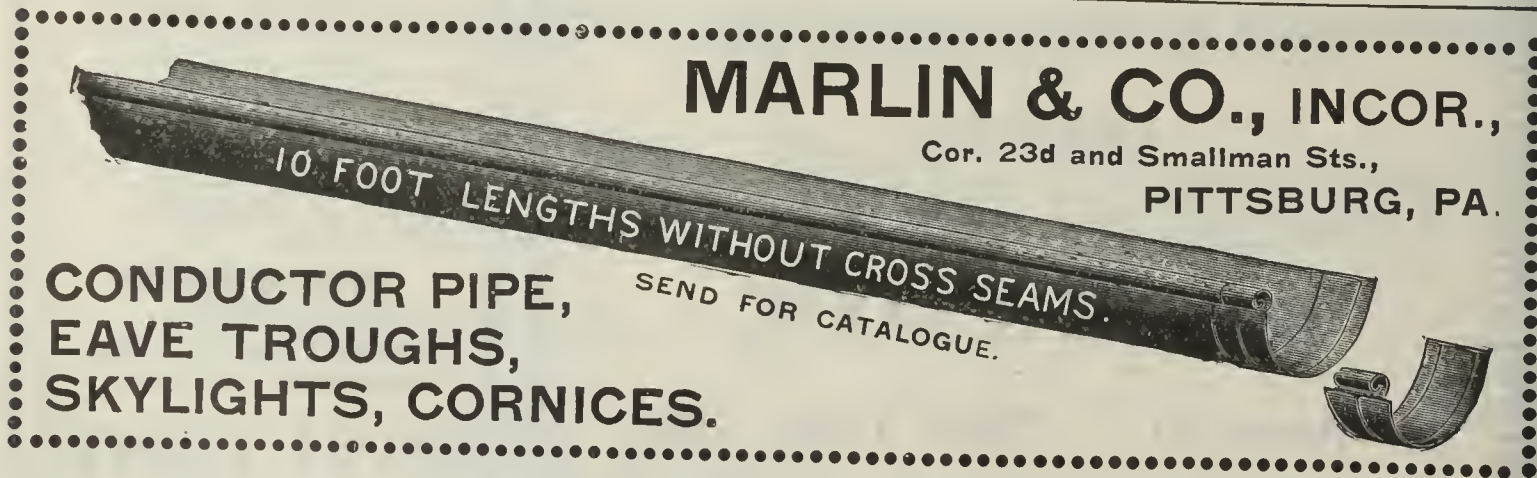

is particularly pleasing and effective, being complete, harmonious and true to style throughout.

Write for free Catalogue No. 5, showing Greek and other noted styles we manufacture.

The New Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting
as applied to all branches
of sheet metal work.

Cloth Bound, Price \$5.

This work contains a collection
of 218 problems and an elaborate
explanation of the principles of
pattern cutting, including Triangu-
lation.

It embodies the problems of the
former Metal Worker Pattern Book,
all of which have been revised, and
many of which have been entirely
rewritten and solved by more ap-
proved methods. To these have
been added 75 new problems and
much other new material and ex-
planatory matter, making this work
a model of completeness in every
respect.

ARRANGEMENT.

In point of arrangement the new
work far surpasses the former one
in that the problems are classified
under three different heads, and
simply indexed, and also that by
means of a table of contents any
required department of the work
can be easily found.

CONTENTS.

While Chapter VI, comprising the
greater part of the work, is devoted
to the solution of problems, the
five preceding chapters thoroughly
explain the principles of pattern
cutting, and place the student in
possession of the preliminary infor-
mation necessary to a thorough
understanding of the subject.

SUMMARY OF CONTENTS.

- I. Terms and Definitions—15 pages.
- II. Drawing Instruments and Materials—13 pages.
- III. Linear Drawing—6 pages.
- IV. Geometrical Problems—35 pages.
- V. PRINCIPLES OF PATTERN CUTTING—25 pages.
- VI. PATTERN PROBLEMS (3 Sections)—325 pages.
 1. MITER CUTTING,
 2. FLARING WORK,
 3. TRIANGULATION.

All Tanners, Cornice Makers and
Sheet Metal Workers should be
provided with a copy of

The New Metal Worker Pattern Book.

Price \$5, post or expressage paid.

The Double Truss Cornice Brake.

All the different sizes in which we make this practical machine are herewith illustrated.

This brake costs only half as much as an all-metal brake.

It is made mostly of hard maple.

It is just as good as an iron brake in every respect—much better in some ways. Beside the 50% saved in the first cost our brake will save money in its use.

It is light and can easily be carried from place to place.

By shaping or bending work in the building where it is to be used all the trouble and expense of handling formed-up work is saved.

Write for prices.

TINNERS' & ROOFERS' SUPPLIES
59 N. 2ND ST.
PHILADELPHIA, PA.

HERCULES SHEARS

make the cutting of sheet metal of heavy gauges an easy task for the mechanic and a profitable operation for the employer. With them a man can cut No. 12 steel with one hand on the lever, leaving the other hand free to guide the stock while cutting elbows, ties and circles, as small as 8 inch radius; this is done without burring or buckling either piece, thus avoiding hammering and straightening, which add to the cost of the product. They split sheets of any width or length up to No. 12 gauge, cut wire or bar-steel $\frac{1}{8}$ inch thick, cut off and mitre angle iron $\frac{1}{8}$ inch thick, and do it perfectly.

PRICE, - - \$35.00.

CATALOGUES ON APPLICATION.

A PERFECT FOLDER for STOVE PIPE and CYLINDERS.

The old style Stove Pipe Folders (Wright's, &c.) cannot be relied on to turn locks of even and uniform widths. The Folder herewith shown overcomes this difficulty entirely.

The Niagara Adjustable Pipe Folder is sure to produce a lock of uniform width the entire length, as variations in the hardness of the material have no influence whatever. It also possesses the advantage of having an adjustable gauge, for locks from 3-16 to $\frac{3}{8}$ inch wide. Length 30 and 42 inches.

★ SAWS ★

Our Star Hack Saws are now used in nearly all Iron-working Shops the world over. They are equally useful for farmers and men in all departments of life. They will cut iron and wood equally well. A nail does not dull them at all. One blade, which costs five cents, will cut off an inch square bar of iron 200 times with out sharpening. We have cut off such a bar 387 times with one blade. All hardware dealers will furnish these saws. If not, we will send one steel frame and six blades by mail, prepaid, on receipt of \$1.00.

All good blades are stamped with a ★

—OFF AT LAST.—“Have you ever loved before?” she asked, gazing at him, tenderly.

“Oh, yes!” replied the racing young man. “I’ve had four false starts. But this is a sure go now.”—*Philadelphia North American.*

—HOW TO ACQUIRE IT.—“It takes generations of good blood and refined rearing to produce that lofty, highbred air, doesn’t it?”

“Oh, no; any girl who is made head clerk in a ribbon department can acquire it in three days.”—*Chicago Record.*

THE ASH PAN

Of the New Model Grand also shares in the march of improvement. It catches and holds all the ashes from the firebox. With the automatic lift dust guards the pan is removable nearly on a level, whereas the ordinary pan has to be lifted out at a 45° angle. The handle is well removed above the surface of the ashes, so it can readily be reached when the pan is full.

by baking on oven bottom and oven rack at same time.

NO CHANGING OF FOOD NECESSARY.

SMITH & ANTHONY CO., Boston.

A Popular Heater.

The Glenwood Hot Water Heater is unanimously approved and praised by dealers in heating goods because of new and practical improvements, especially the one piece construction which is acknowledged a great talking point over other boilers which are made in sections and sooner or later burn out and leak at the joints. Write for catalogue.

Paragon Point No. 6.—PERFECT ADAPTABILITY.

While hard coal is mostly used in the Paragon Furnace, we make it to burn soft coal as well, and pea coal or coke can be burned in any size and any style. The Paragon line is also adapted to low cellars, and we have a form of it for bricksetting. We also make a combination Paragon with either steel or cast iron radiators.

This point means that whatever your requirements may be in the furnace line, you need not go outside of the Paragon Furnace catalog to meet them.

ROUND OAK

Standard of America

We wish to again call attention to the merits of the Genuine Round Oak as a Hard Coal Stove. With or without the magazine, it does perfect work. It is all "business," no non-radiating mica and nickel plate. Every part radiates heat, consequently it saves lots of fuel. Then, too,

Wood can be burned Fall and Spring

and should hard coal get too costly or hard to get, soft coal can be burned to better advantage than in any other construction on earth. Do you wonder it heads the procession and leads, in sales, the world of heating stoves? Do you sell it?

RANGES.

Finest Factory in this Line in the World.

READ OUR OFFERINGS.

Special Advantages Over All Other Heaters.

OUR HEATERS are only 4 ft. 3 in. high, giving excellent elevation for Hot Air Pipes.

OUR HEATERS ARE ALL CAST IRON, no repairing of sheet iron drums necessary every few years.

OUR MANIFOLD TUBES are steel, $\frac{1}{8}$ inch thick, and will wear for a lifetime.

OUR HEATERS are supplied with the most modern grates, perfect dumping and shaking. Each bar can be separately replaced.

OUR HEATERS are so arranged that they can be perfectly cleaned by any one, and in a few moments.

Equally Efficient with Hard or Soft Coal.

Our Heaters save the heat others waste up the chimney and send it through the house, therefore reduce coal bills.

THE NEW "MILLER"

The Latest, Best and Handsomest Range
on Earth.

AN EXPERIENCE OF FORTY YEARS enables us to place these Ranges upon the market so far in advance of all other Steel Ranges that it would be but a sheer waste of time for any of our self-styled competitors to attempt to keep pace with them.

The Miller possesses all of the *Latest Improved Modern Appliances*, and is constructed *strictly upon Scientific Principles*, with a view to *Economy, Durability, Perfect Baking, Cleanliness and General Utility*, and with our long experience in the construction of Steel Ranges we candidly say to you that these Ranges are the results of our best efforts.

Special attention is called to the easy manner of Removing and Replacing the Grates and Grate Frames in these Ranges without interfering with the Water Backs or Linings. Simply by taking out the small bolt and removing the Front Grate the entire Bottom Grate and Frame can be drawn out through the Front Draft Door. Attention is also called to the New Non-Warping Oven Bottom, which is made in two pieces. Each piece is flanged downward, then firmly riveted together, which stiffens the bottom. The seam is thoroughly protected underneath, and the bottom is firmly riveted to the bottom of the Range, making practically a Perfect Non-Warping Oven Bottom. When Wood is burned exclusively in these Ranges we extend the Firebox the full depth of Range, and put on a Swing Feed-Door. Same price.

A 62-PAGE PAMPHLET

Comprising a Series of Articles and Letters on *Chimney Troubles and Their Remedies* published under the title

Contains a compilation from the columns of THE METAL WORKER, of articles and correspondence relating to house chimneys, defective flues, and kindred topics, comprising a source of information of the most practical and reliable nature, on overcoming difficulties which occur in the working of chimneys, flues, etc.

To all who are interested in flues and drafts, in their relation to stoves, furnaces and house heating apparatus, this book will prove instructive and helpful.

The Contents are as follows

	Page.
POINTS ON CHIMNEYS . . .	7-32
An illustrated article by J. L. Bixby, Jr., describing many details in chimneys, which cause trouble, and giving remedies. An important table is presented, of the sizes of chimneys required in dwelling houses, based upon the amount of work to be done.	
DEFECTIVE FLUES . . .	33-35
This article presents information resulting from a wide, practical experience of the writer, and gives sound advice on some of the details of chimney construction.	
HOW TO IMPROVE A WEAK CHIMNEY	36-40
VARIOUS FORMS OF VENTILATORS or CHIMNEY TOPS	41-45
CONDENSATION IN STOVE PIPES	46, 47
SMOKE PIPE FOR WOOD FURNACES	48
REMEDYING DOWN DRAFT IN CHIMNEY	49-51
CONNECTED FLUES DESTROY DRAFT	52-55
FAILS TO BAKE ON BOTTOM	56-62

40 good Illustrations help to make the Text clear.

Nothing Equal to It.

It was Goethe, you recollect, who declared that "to find some one who thinks as I do strengthens my belief." Well, here's what one individual who has thoroughly tested the

GURNEY

"Bright Idea" Heater

thinks of it: "My house is large and exposed, but I can heat the whole of it with the mercury at zero outside. I believe there is nothing equal to the 'Gurney' for heating a house."

If such testimony were rare, of course it would carry less weight, but when we assure you that we have on file hundreds of letters of the same tenor, it seems almost impossible for you not to comprehend the excellence of the "Gurney" Heaters.

But, having comprehended it, why not make use of it? Become our agent and then you'll share its benefits. For just so long as merit finds appreciation, just so long are "Gurney" Heaters bound to sell in increasing numbers.

Furnace Heating.

A Practical and Comprehensive Treatise on Warming Buildings with Hot Air, by William G. Snow, with an Appendix on Furnace Fittings. 170 pages; size, 6 x 9 inches. Cloth bound. Price, \$1.50.

This is the only book that has been brought out which presents a systematic and reliable treatment of the warm air furnace system of heating.

It deals with the various types of furnaces, their construction, proper location and setting, together with furnace fittings, and all matters pertaining to the installation of furnaces and to effective and economical heating by warm air. The subject is discussed for the first time by a competent author possessed of a scientific education and a practical training, who presents positive rules, based on a long experience, for guidance in designing furnace systems for dwellings and other buildings where this popular method is employed. The various details of furnace work are described simply and at such length that the volume will be valuable to all who are in any way interested in the subject. It is recommended to practical furnacemen, to architects, builders and house owners, and to tinnery and plumbers in suburban sections who do furnace work. To all these it will prove a reliable text-book and guide.

PARTIAL SUMMARY OF CONTENTS
BY CHAPTERS.

Chapter I.—Furnaces—Is devoted to Furnace Construction—The Relative Proportion of Furnace Parts—Secondary Heating Surface—Economy and Efficiency—Heating Capacity and Exposed Wall Surface—Manufacturers' Ratings of Their Own Productions, etc.

Chapter II.—House Heating—Compares Furnaces and other apparatus, and describes Method of Setting Brick and Portable Furnaces—Location and Area of Cold Air Supply—Cold Air Rooms and Air Filters—Return Ducts and Air Circulation—Size of Hot Air Pipes—Location of Registers, etc.

Chapter III.—The Combination System—Discusses Heating Distant Rooms with Radiators—Balancing the System—Location of Water Heater in Furnace—Capacity of Water Heaters—Size of Radiators, etc.

Chapter IV.—Air—Deals with the Necessity of Ventilation—Water Needed to Moisten Air—Expansion of Air—Velocity of Air in Tubes, etc.

Chapter V.—Heating and Ventilation of Buildings—Considers the Size of Furnaces Required—Fresh Air Room and Supply—Air Circulation—Size of Flues—Use of Stack Heaters—Size of Heating Coils in Vent Flues, etc.

Chapter VI.—Heating of Public Buildings, Churches and Stores—Is given to the Size of Furnaces Required—Grate Surface in Ventilated Buildings—Air Supply—Size of Heating and Ventilating Flues—Size of Stack Heater, etc.

Chapter VII.—Fan-Furnace Combination System—Is devoted to Positive Warm Currents from Fan Systems—Location of Fan and Driving Apparatus—How Good Furnaces are Aided by Fans—Types and Efficiency of Fans—Area of Ducts and Flues, etc.

Chapter VIII.—Temperature Control.

Chapter IX.—Estimate and Contract Blanks.

Chapter X.—Value of Fuels. The Proper Size for Furnace Chimneys—with tables.

APPENDIX.

Furnace Fittings.—A section of 45 pages dealing with the Making of Furnace Casings—Metal Cold Air Boxes—Making Furnace Bonnets and Collars—Making Pipe and Elbows—Register Boxes and Stack Shoes, etc.

**The Climax
RATCHET STOCK**Is an indispensable tool for
conveniently threading iron
pipe in ditches, under floors,
in corners, over head, etc.
With this tool threads can be
cut without removing whole
lengths of pipe. This tool is
provided with a strong vise
which securely grips the pipe
and by means of the leading
thread the die is forced on pipe
and the thread is cut. It is
made of malleable iron and
steel, and while light in weight,
making it convenient to carry,
is very strong and rigid. The
advantages of this tool make
it absolutely indispensable to
Plumbers, Steam and Gas Pipe
Fitters, Gas and Water Com-
panies, Machinists, etc. It
takes standard size dies, which
are extra if furnished.No. 1 threads $\frac{1}{4}$ to 1 in. pipe,
takes 2 or $2\frac{1}{2}$ in. die, \$10.00.No. 2 threads 1 to 2 in. pipe,
takes $2\frac{1}{2}$, 3 and 4 in. die, \$17.00.

The Texas Oil Product.

It seems that the owners of the oil wells in the Beaumont district of Texas are facing a serious problem in the marketing of their product. According to the latest statistics the total production of the various gushers in the Beaumont district approximates 1,500,000 barrels of oil a day, or over 500,000,000 barrels a year. This immense output largely exceeds the entire production of the rest of the world. The total production of petroleum in the United States since the first discovery in 1859, and down to the close of the year 1900 amounted to only 1,006,876,000 barrels, or about double the capacity of the Beaumont wells for one year. The entire oil production in the United States last year was about 60,000,000 barrels, or less than 200,000 barrels a day, which is only about one-seventh of the total production of the Beaumont fields at the present time. If, however, a report recently sent out from Beaumont, to the effect that at a test made a short time ago of crude petroleum obtained from the Spindle Top field it yielded at the refinery between 30 and 35 per cent. of illuminating oil, be accurate, then the problem of how to dispose of the large product of the Texas wells can be partially solved by the establishment of local refineries for the purpose of extracting the illuminating oil. There is practically an unlimited demand for illuminating oil, whereas that for crude petroleum is at present comparatively limited. At the same time if the experiments now being made in many quarters with crude petroleum for fuel purposes and improved apparatus for its use are satisfactory, they will undoubtedly lead to the adoption of oil fuel in many places as a substitute for coal or wood. Already a number of concerns are preparing to pipe oil from the Texas fields to New Orleans, Galveston and other ports. These pipe lines, when completed, would provide an outlet for a large amount of the refined product, which could be shipped in bulk from the Southern ports to foreign countries. By means of tank cars the oil also can be readily transported by rail to points in the West and South, where a large demand should be found for fuel oil in places where coal for manufacturing, power and heating purposes is a costly item of the expense account. It has seldom occurred in the history of any natural product that the supply so far exceeded the possible demand that new uses could not be found for it. And it is not likely that the production of the Texas oil wells will long be a drug on the market, particularly as cheap fuel is one of the things most loudly called for by the manufacturing interests of this and other industrial nations.

Securing Foreign Markets.

Although, according to official statistics, our exports have of late been making a new record, it is to be noted that the exportation of manufacturing merchandise shows something of a falling off in value, as compared with that of a year ago. One of the influences which has checked the foreign sale of American products is the heavy demand here, accompanied, as it has been in some lines, by higher prices. This condition has operated in two ways, as English and Continental competitors have been enabled, especially with their declining markets, to undersell the American manufacturers, while at the same time the urgent requirements of the home market have interfered with promptness in shipment to the foreign markets. The effect of the great steel strike in augmenting the force of both of these influences is obvious.

It is not improbable that American manufacturers are in a measure blameworthy for any actual or apparent falling off in the sale abroad of their products. There is a great temptation to attend to the home trade even to the neglect of a foreign trade beginning to assume large proportions, and thus preparing to justify in practical returns the labor and expense with which it has been brought to this point. The importance of steadily and consistently cultivating the foreign market while the merchants abroad are in a receptive humor cannot be too strongly impressed on manufacturers. While the bulk of their production is absorbed by domestic trade, it must not be forgotten that when the supply catches up with the demand here there will be a universal scramble for other markets. There is undoubtedly, on the part of foreign buyers, a disposition to cultivate this country as a source of supply, and our manufacturers are becoming more generally and favorably known to merchants all over the world, who previously looked to London, Paris, Berlin, Hamburg and other European centers for the supply of their wants.

While these favorable conditions continue there should therefore be an earnest and unremitting attention to the requirements of foreign customers, even to the temporary inconvenience of those at home, and at the same time a vigorous extension of foreign relations, which are sure to be of great value when the domestic demand relaxes. The wise manager will look beyond the present convenience and profit and establish his connections in advance. The opportunity is so full of promise that it should not be neglected.

Compulsory Arbitration.

Considerable interest has been shown the world over in the system of compulsory arbitration of labor disputes in vogue in New Zealand. It was believed in some quarters that the adoption of this system would furnish a satisfactory solution to the problem of the prevention of strikes and the adjustment of labor disputes. It seems, however, that the New Zealand system has not in all respects worked out to the satisfaction of either the employers or the employed. According to a statement made by J. Grattan Grey, a prominent New Zealander now in the United States, the system of compulsory arbitration as operating in his country is by no means

a success. In fact he says it has proved so ineffectual as to leave strong doubts as to the desirability of its continuance. The accusation is made that the members of the Board of Arbitration are in the habit of prolonging cases in order to secure the fees that are paid to them each day in which they are occupied thereon. Mr. Grey says further that the arbitrators encourage disputes, with the result of making capital timid and arresting the development of industrial enterprise. Of 90 cases brought before the Board of Arbitrators in the ten years, from 1890 to 1900, only 29 were settled. Thus it would seem that the enthusiastic reports of the beneficial effects of the compulsory arbitration system in New Zealand published from time to time should not be completely relied upon. New Zealand has for many years been held up as a criterion in labor matters. The workman there is in the ascendant, and her legislature is practically controlled by the labor vote. Yet the millennium of labor and capital still seems afar off, even from the point of view of the worker in that country.

In the report of the Industrial Commission on labor disputes and arbitration, just issued, the commission note a growing movement in favor of conciliation and arbitration between organizations of employers and employees in the United States. This system has been adopted in a number of single industries throughout the country or throughout sections where the conditions of business are generally similar. Systems of arbitration have been established on a national scale in the stove molding, general foundry, machinists' and printing trades. The report gives great credit to the State boards of arbitration, which are doing much toward furthering industrial peace. Representatives of employers and workmen, however, who testified before the commission almost uniformly opposed any system of compulsory arbitration. Several State boards of arbitration also have expressed their opinion against the adoption of the principle, although the New York, Indiana, Ohio and Illinois State laws provide for compulsion in certain cases, as where life and public welfare are in danger or great inconvenience or loss is entailed on the public, as in railroad strikes.

The Freight Car Shortage.

The steel furnaces and works in the Pittsburgh district, as well as those in other parts of the country, are suffering at the present time from a pronounced scarcity of coke, owing to the shortage of cars for the transportation of this fuel from the ovens. So serious is the scarcity in some parts that blast furnaces have been obliged to bank down for days at a time on account of lack of fuel. This tends to cut off a considerable production of pig iron and still further to reduce the available stocks, which are now none too large to meet the consumptive requirements of the country. The lack of freight cars is also being felt by manufacturing and commercial interests at large. It involves exasperating delays in the delivery of raw materials and also in the transportation of finished goods to their destinations. It is obvious that the equipment of the railroads is not equal to the heavy traffic which they are now being called upon to move. The shortage of the corn crop, which it was expected would cut down the business of Western railroads quite considerably, seems to have been more than made up by the record breaking movement of general merchandise. The railroad companies, while asserting that they are doing their very best to meet the requirements of their patrons, hold out no hope of relief from the present stringency for some time to come.

Anxious to Learn a Trade.

A man who has acquired the mastery of any trade has always been considered a valuable citizen of any country. In fact it has been pointed out that those nations are strongest which have the greatest number of skilled artisans. With such an idea prevailing and coming down for several generations it is not strange that many young men are eager to learn a trade, even if they find some difficulty in making a selection. Of late years the ambitions in this direction of young men in the United States have been very much discouraged by the difficulty of securing an opportunity to learn a trade and the conditions which they must meet when the opportunity is offered. In some of those trades in which our readers are interested considerable difficulty has arisen in the past few years over the question of taking on apprentices. Some men know that with the manner in which shops and business are conducted at the present time it is difficult to give to an apprentice the attention and instruction that he is entitled to when he is bound by his indenture to give his entire time to his employer. Conscientiousness on this point has caused many employers to refuse to take apprentices. Instead they have hired laborers to do the work which ordinarily falls to the apprentice during the early part of his apprenticeship. Restrictions have also been imposed in many of the trades as to the number of apprentices that shall be employed in a shop. Owing to these two conditions the field for recruiting skilled mechanics is becoming more and more circumscribed. It is this fact that caused a surprise to one of the judges in Newark, N. J., recently, when he received a note from two boys begging him to send them to the State's prison for two years rather than to a local penitentiary for a shorter term. On sending for these young men—who in all probability would never have been brought before him had they been honestly engaged in learning some trade—the Judge learned that the ground of their desire for a longer sentence at the State's prison was that it would afford them an opportunity to learn a trade. The Judge granted their request, expressing the hope that it would make better men of them. Both the prisoners thanked him.

Reports from various sections of the country indicate continued activity in the building trades, in some instances upon a scale which breaks all records for corresponding periods. The increase in the cost of building materials seems to offer little if any check to active operations, and it is probable that the volume of building for 1901 in the aggregate will exceed that of any recent year. Labor troubles are comparatively unimportant, and the outlook is for an amicable adjustment of difficulties where they now exist.

On December 1 the South Carolina Interstate and West Indian Exposition will open its doors in the city of Charleston, S. C., to remain open until June 1, 1902. The preparations for the exposition are reported to be well forward and great things are hoped for it by the promoters of the enterprise. The exhibits will cover the products of the entire South, the West Indies, Cuba, Porto Rico, the Philippines, Mexico and the South and Central American republics.

In an article on "The Lipton System of Business," published in a popular periodical, Sir Thomas Lipton gives his receipt for success in the following words: "Work hard; deal honestly; be enterprising; exercise careful judgment and advertise freely and judiciously." In following out these principles the noted Irishman has achieved a remarkable degree of prosperity. His maxims are worth remembering and adopting.

Warming a Chapter House.

There are several features in the system used for warming the Beta Theta Pi Chapter House in Syracuse, N. Y., that will interest furnacemen in a description of it. Those who are giving attention to this branch of heating may derive benefit from a study of the methods adopted for meeting the peculiar requirements presented and special interest will attach to the plant owing to the fact that it has undergone the only practical test—that of actual use through a winter—with entire satisfaction to all concerned.

In Fig. 1 is given a general view of the chapter house, which stands on the side of University Hill, Syracuse, N. Y. The building faces the east, with one side hav-

A No. 30 Kelsey warm air generator was selected for the work. Owing to the large number of heating pipes required in order that a separate and independent pipe could be provided for heating each room, the dome or bonnet of the generator was enlarged so as to provide sufficient space for connecting the 21 pipes used.

Warming a Chapter House.—Fig. 1.—View of House, Showing East Front and North Side.

Fig. 2.—View of Kelsey Generator, Showing Extended Dome and Air Supply Connection.

ing a full northern exposure, and the west end is open to the sweep of the wind. Owing to the building being used by 30 students, it was necessary to have each of the 21 rooms, as well as the halls, warmed to a com-

The construction of the dome is shown in Fig. 2, which gives a general view of the generator. The dome extends 7 inches beyond the line of the casing, and has the effect of providing a large warm air reservoir, which

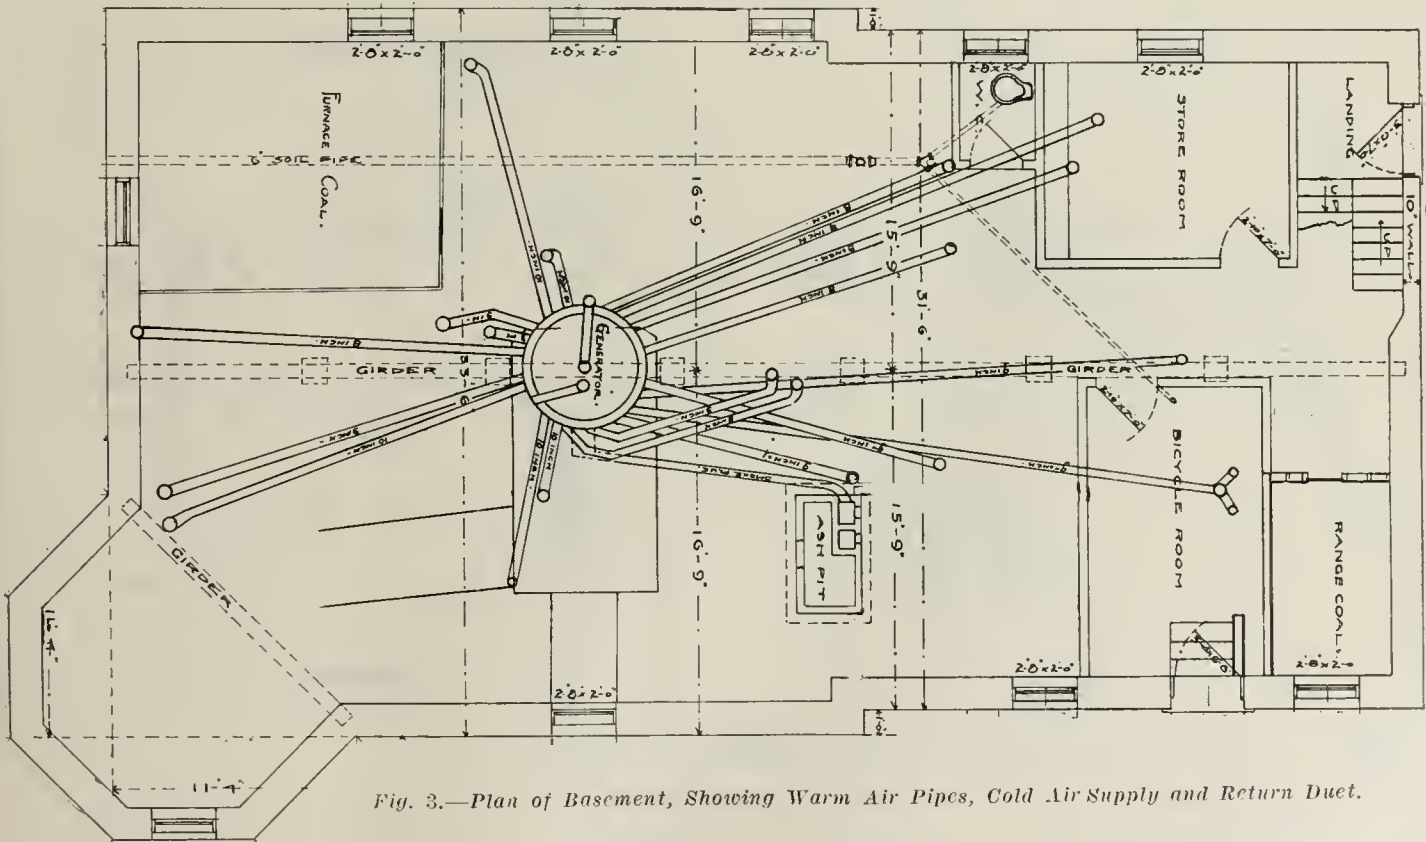

Fig. 3.—Plan of Basement, Showing Warm Air Pipes, Cold Air Supply and Return Duct.

fortable temperature, so that the occupants might use them for study at all times. These were the conditions which confronted the Kelsey Furnace Company of Syracuse, N. Y., who installed the plant, which was designed by Edward S. Berry, one of their heating engineers, under whose immediate supervision the work was done.

insures a steady flow of warm air to each of the pipes connected with it. The dome is not only lined on the inside with asbestos sheathing and tin plate, but the asbestos felt covering the warm air pipes also extends down over the dome below the upper casing ring. In this way the 21 hot air pipes connected with the furnace

are so arranged as to receive the proper supply of warm air.

The arrangement of the piping is shown in Fig. 3, which is a plan of the basement. It will be noticed that

way to the generator, where it changes to a 14 x 80 inch galvanized iron duct. This is 20 inches wider than the diameter of the generator and allows the duct to extend around toward the front of the generator on both

Fig. 4.—Plan of First Floor.

one pipe, which runs to the northwest end of the building, branches and connects with two risers for heating rooms on the second and third floors. Wherever a large number of pipes are supplied it is necessary to provide

sides to within 10 inches of the ash pit door frame. This method of connection is adopted so that an abundant supply of air can be furnished at the front portion of the generator.

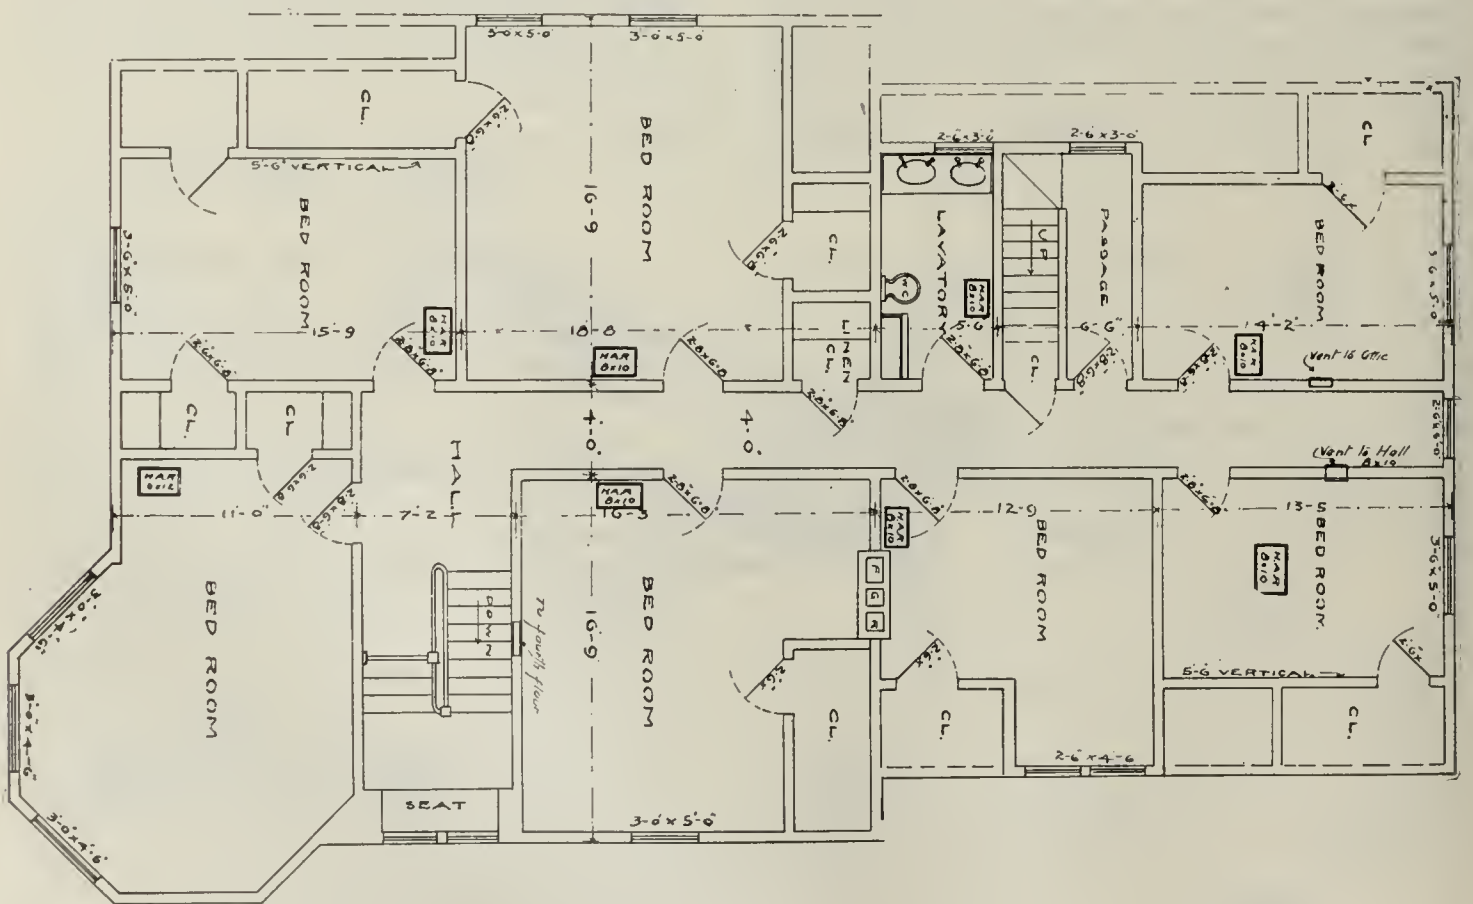

Fig. 5.—Plan of Second Floor.

for an ample supply of fresh air, and the method of connecting the air ducts with the furnace is shown in Fig. 3. The air is supplied from both out of doors and from a 24 x 32 inch register in the floor of the main hall. Fresh air is taken from a window on the west side of the building through a duct 24 x 32 inches in size part

While many furnaces have an air supply duct that is ample in area for the purpose the method of connecting it is such that the front portion of the apparatus is not properly supplied, and particularly when heating pipes are attached to the front of the apparatus. With the use of the extended dome, providing an air chamber

at the top, and the cold air supply delivering its fresh air evenly to all parts of the furnace, it is pointed out that the difficulty of filling all pipes equally has been satisfactorily overcome. In addition to the cold air duct from the outside a 14 x 34 inch exhaust duct made of

ting off the supply of outside air. The outside air is taken from under a large porch on the north side of the building, which prevents strong winds blowing into it and practically performs the same functions as a fresh air room in a cellar.

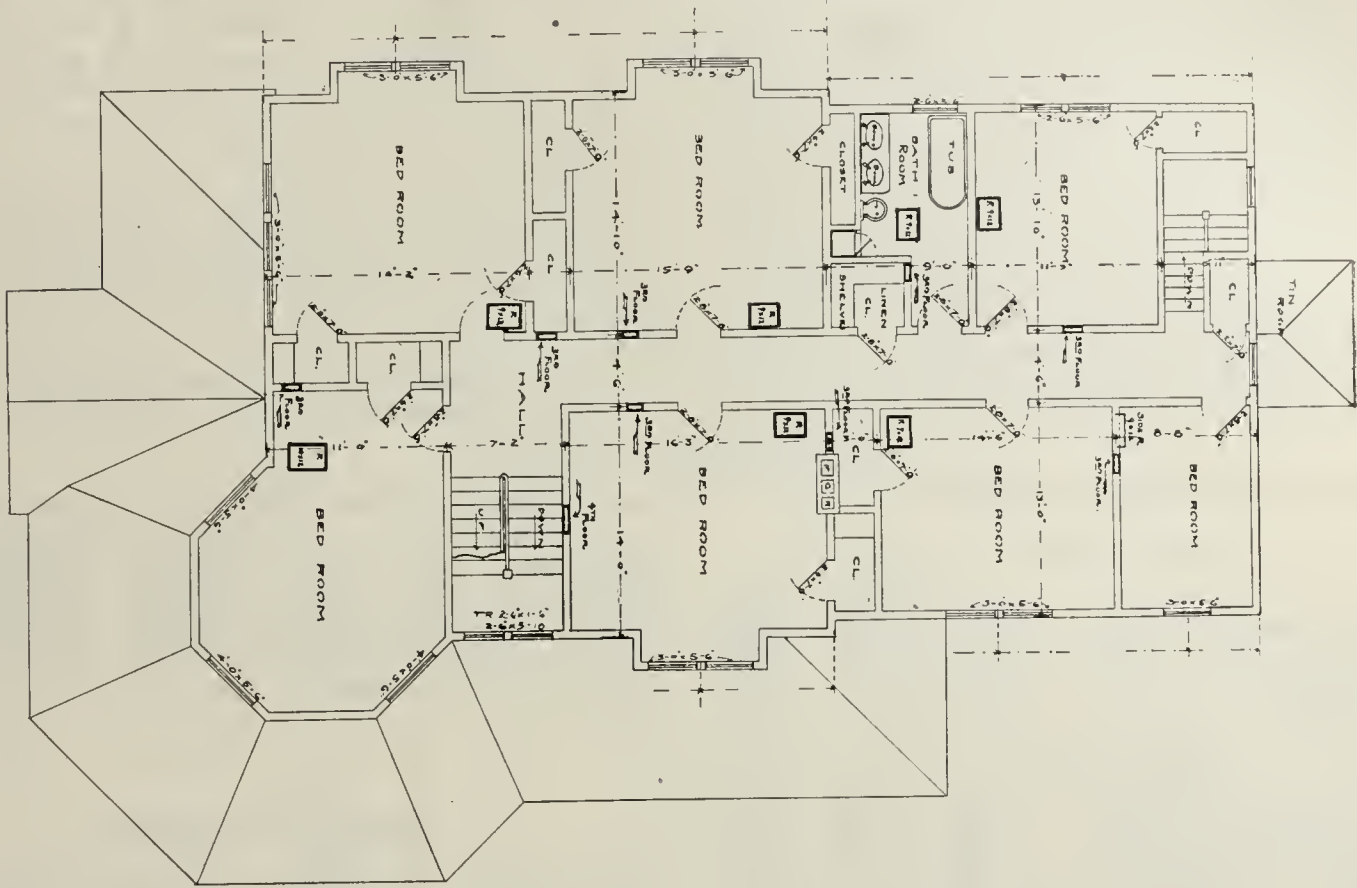

Fig. 6.—Plan of Third Floor.

wood is carried from the 24 x 32 inch cold air register located in the main hall. At a point where the exhaust duct connects with the main duct a partition is placed

The main hall of the building extends to the third floor, with all the rooms opening into it, and by exhausting the air through the large cold air register placed at

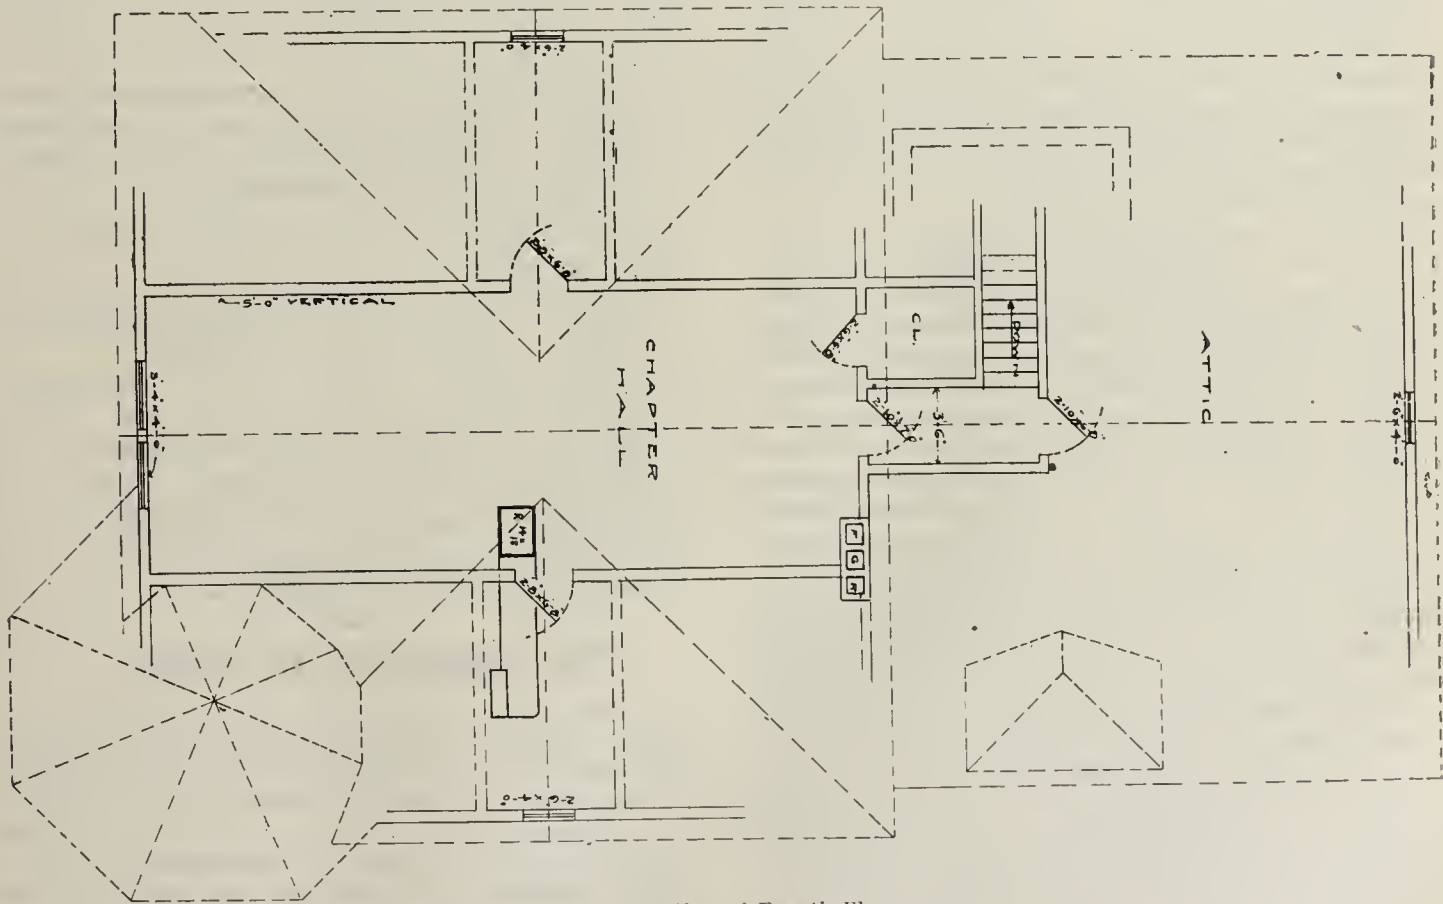

Fig. 7.—Plan of Fourth Floor.

in the main duct running all the way to the ash pit, entirely separating the inside and outside supply of air. The outside duct is provided with a slide located near the cellar window, in which there is a hole 9 inches in diameter, so as to prevent the possibility of entirely shut-

the foot of the stairs a good circulation of air throughout the house is secured. A plan of the first floor is given in Fig. 4, showing the location of the cold air register in the hall, the hot air registers in the floor and the hot air lines leading to the registers on the upper

floors. The plans of the second and third floors are given in Figs. 5 and 6, and a plan of the fourth floor in Fig. 7, the only portion of this floor that is heated being the chapter room. This room is heated by means of a 10-inch hot air pipe from the generator connected with a 6 x 14 inch flue running up in the partition to the fourth floor, where it is carried over and connected with a 14 x 18 inch register in the floor. In two of the west rooms on the third floor ventilator registers are placed in the side wall near the ceiling, one leading to the hall and the other leading to the attic. They are for the purpose of securing a circulation of air through them to assist in warming the rooms, owing to their western exposure.

To aid in the heating, and more particularly to effect positive ventilation, there is a large fire place in the library on the first floor. This fire place connects with a flue 8 x 12 inches, which has a terra cotta lining. A similar flue is provided for the furnace, and as the chimney is over 60 feet high a strong exhaust for ventilation and draft for the furnace is secured. The registers used are of a very open pattern made by the Tuttle & Bailey

the equivalent glass surface exposed in the rooms warmed. To aid in making a comparison the dimensions of the various parts are also given, as follows: The grate, being 30 inches in diameter, has an area of about 720 square inches, or 5 square feet. The heating surface exposed in the furnace is 191 square feet. The 21 hot air pipes supplied consist of nine 8-inch, seven 9-inch and five 10-inch pipes, with a combined area of 1281 square inches. The air supply consists of a 24 x 32 inch fresh air duct, having an area of 768 square inches, and a 14 x 34 inch exhaust duct from the main hall, having an area of 476 square inches. These connect into a 14 x 80 inch duct, having an area of 1120 square inches, which connects directly with the furnace. The space directly heated amounts to 47,519 cubic feet, and considering that 10 square feet of wall surface will lose as much heat as 1 square foot of glass surface, the space heated has an equivalent glass surface of something over 1150 square feet.

A very interesting piece of information in connection with the heating plant is the statement that about 20 tons

Mfg. Company, New York. The warm air pipes, both in the partitions and in the cellar, are made of substantial material, and throughout their entire length are covered with heavy asbestos felt.

The Kelsey generator used for this work was the No. 30, which has a grate and fire pot 30 inches in diameter. The construction provides a large combustion chamber above the fire pot. It is formed of 16 oblong, triangular shaped cast iron flues leading from the grate line to the top of the radiator. The products of combustion rising from the fire leave the main chamber through interstices between the cast iron hot air flues and pass to the outer chamber, which consists of a steel plate drum reaching the full height of the radiator. On entering this chamber the heated gases are forced to take a downward turn and pass under a horizontal partition and around the rear to the final smoke outlet. By this construction the outer steel plate drum and the cast iron heating flues present a total hot surface of 191 square feet, with which the air must come in contact in passing through the furnace. It will be noted that the surface is so divided up that air cannot pass upward without either coming in contact with the surface or mingling with air that has been heated, so that it reaches the large hot air reservoir provided by the extended dome at the top at a temperature calculated to do efficient work when it reaches the registers through the insulated warm air pipes and risers.

In order that those who desire to consider or compare the proportions and dimensions of the details of the work, a table is presented which gives the dimensions of the rooms, the space heated, the wall, glass and equivalent glass surface exposed, the diameter and area of the hot air pipes, the sizes of the registers and the proportion of hot air pipe area to the space heated, and to

of coal were consumed during the winter. The proportions existing between these different parts of the heating system are given in the following table:

Proportions of Various Parts of Heating System.

Grate:

- 1 square inch to 66 cubic feet of space heated.
- 1 square inch to 1.6 square feet of equivalent glass surface.
- 1 square foot to 38 square feet of furnace heating surface.
- 1 square foot to 9504 cubic feet of space heated.
- 1 square foot to 230 square feet of equivalent glass surface.

Furnace heating surface:

- 1 square foot to 248 cubic feet of space heated.
- 1 square foot to 6 square feet of equivalent glass surface.

Hot air pipe area:

- 1 square inch to 37 cubic feet of space heated.
- 1 square inch to 0.9 square foot of equivalent glass surface.

Coal per season:

- 1 ton to 2375 cubic feet of space heated.
- 1 ton to 57½ square feet of equivalent glass surface.

The Chappell Hot Air Furnaces.

The New Century catalogue of the Chappell Hot Air Furnace Company of Morenci, Mich., presents a number of illustrations of the Chappell hot air furnace, designed for burning coal and wood. The construction of the furnace will be of interest to furnacemen, on account of its peculiar features. The fire box and combustion chamber are constructed with heavy corrugations so as to increase the heating surface with which the air must come in contact in passing through it. As the products of combustion rise in this chamber they enter a solid cast iron oval shaped radiator, and must make a complete circuit of the furnace before entering the diving flue, which connects with the final smoke outlet. The furnace is made in several styles—some with cast iron and

some with steel radiators. The Morenci City steel furnace is of similar design, but is constructed entirely of sheet steel. Furnacemen who are located in a country where wood is burned and who cater for the heating of schools, churches and large buildings will be interested in a study of this catalogue, which can be secured on application.

Death of a Pioneer Stove Maker.

Josiah M. Read of Everett, Mass., one of the pioneer stove manufacturers of Boston, died on November 6 at his home in Everett, aged 92 years. Mr. Read had been an invalid for several years, and death resulted from old age. He was born in Sandwich, N. H., and in 1839 went to Boston, where he began the manufacture and sale of stoves on Blackstone street, remaining there until 1888, when he retired from active business at the age of 80 years. Mr. Read was one of the first manufacturers of cooking ranges in the United States, but is better known to the trade through his many inventions pertaining to stove construction. The Read damper is used in many of the best ranges on the market. He was probably the first maker of stove and furnace poker, fire shovels, &c., for the trade. In the furnace poker iron pipe was used having suitable handles and prongs at the ends. He represented his district in the General Court of Massachusetts for three years, and was known for more than half a century as one of the progressive business men of Boston. He was an enthusiastic worker in the cause of temperance and was a deacon of the Congregational Church.

The Favorite Furnaces.

With a view to commanding the attention of those who may be interested in the purchase of heating apparatus, the Peck-Williamson Company, Cincinnati, Ohio, are sending to the trade two catalogues of their furnaces and heating and ventilating apparatus. One, devoted to the Favorite furnaces, opens with a page of special information for the trade, followed by information which will be of interest to the final purchaser. Common mistakes in furnace construction and setting are explained, and the points of difference between the construction of the Favorite furnace and others are enumerated. The illustrations show the Favorite furnace provided with a deep ash pit, in which is supported a labor saving, agitating grate, above which rises a porcupine fire pot designed to present a large heating surface and to prevent overheating. Above the fire pot is a radiator, constructed with a large central combustion dome, at the base of which are a series of flues leading to an annular drum, of which the products of combustion must make a complete circuit before they escape to the chimney.

Illustrations are also presented of the Favorite Under Feed furnace. This furnace has a hopper into which the fuel is placed, while a lever with a gearing at the bottom operates a piston which pushes forward and up through an opening in the center of the grate a new charge of fuel whenever the fire needs replenishing. The 500 Series Favorite is made with a steel combustion chamber and outer annular drum. The Favorite furnace is made with a tubular radiator. Two other styles of the Favorite furnace are furnished with a high radiator of cast iron, and a high radiator of steel respectively. The catalogue closes with cuts showing a twin furnace connection, the Gage water pan, which is used in connection with floor registers, the porcupine fire pot and the Favorite improved metal clothes dryer, for use in the laundry.

The second catalogue is suggestive of the material so largely used in furnace work, having a binding covered with bright tin foil. This catalogue shows the special furnace made by the company for church and school heating, adapted for use on a gravity system or in connection with fan blowers. Sectional pictures of parts of buildings are given to show the application. This catalogue furnishes useful information on school furnaces and the heating of school buildings.

A Gas Goods Catalogue.

We have received the annual catalogue of Fletcher, Russell & Co., Limited, of Warrington, England, consisting of 200 pages illustrated with half-tone engravings, some of the goods being printed in colors to illustrate the special majolica enamel finishes in which they can be furnished. The catalogue is devoted to gas fires, heating stoves, foot stoves, condensing stoves and greenhouse boilers, and gives useful information in reference to results obtained by means of radiant heat from different varieties of gas fires and the character of fires best adapted for the sick room and chambers. The first 40 pages are devoted to cast iron gas fires of various design, all with an open front, filled with fire clay fuel, which becomes incandescent in use, throwing out strong heat to the apartments in which they are used. In another section are shown stoves having sheet iron bodies and constructed with fines for presenting additional heating surface, or diffusing currents of warm air. Radiant or reflector stoves occupy another section of the catalogue and the last part is devoted to various lines of greenhouse boilers, designed to utilize the heat of the gases to the full extent before they escape.

The Charm Crawford Range.

J. Q. A. Butler is showing, at 115 Beekman street, New York, one of the Charm Crawford ranges, made by the Walker & Pratt Mfg. Company of Boston, Mass., which is attracting considerable attention, owing to the beauty of its design and finish, as well as on account of some of the constructive features. One positive advantage of the range is the ease with which the nickel plated parts can be detached from the range for repolishing the nickel or blacking the range. Instead of steel bands, which a foundry house must naturally purchase from some other plant, the edges are ornamented with nickel plated castings, which not only have a fine polished surface, but also afford an opportunity for ornamental design, adding to their beauty. The damper is unique, being arranged so as to give a direct draft for kindling a fire and an indirect draft for baking, as well as to check the draft so as to keep in the fire when the range is not in use. Another novel feature is the tin lining in the back of the oven, which not only retains the heat of the oven, but prevents the cold atmosphere from chilling the oven at the back. The tin plate reflects the heat, and also reflects the light so as to light up the oven when the oven door is open. These are only a few of the novelties which have made this range much talked of in the trade and attracted many visitors to inspect it.

ODD PLATES.

THE SHEFFIELD STOVE & FOUNDRY COMPANY, Sheffield, Ala., advise us that they have had during the whole year more business than they could handle. They kept only one salesman on the road, and he has been taken off for the past two months. Three years ago the company employed ten molders; now they have 35, and they expect to employ 50 next year.

F. O. Alsop, Syracuse, N. Y., who is well known to the Stove, Range and Furnace trade from his long connection with it, has associated himself with the Syracuse Heater Company, Syracuse, N. Y., as general sales agent for the Syracuse Hot Air Furnace, patented by Charles J. Howard, president of the company. Mr. Alsop will visit and correspond with the trade in the interest of the Syracuse Heater. This Furnace is of the return flue construction and presents a large amount of heating surface, on which is based the claim of the manufacturers for large capacity and economy.

It is stated that 1300 finished Stoves were shipped from the Lansdale, Pa., plant of the Abram Cox Stove Company the third week in October, which was a record breaker for the local foundry.

THE QUAKERTOWN STOVE COMPANY, Philadelphia, Pa., report a very large trade in all lines of heating goods, as well as in Ranges, &c. The company have had a particularly active demand for what they call

their "big little range," the Rex, which they have been unable to meet. The same thing is true of their various lines of Gas Heaters. The volume of business done by the concern is said to be well ahead of that of the same period of last year.

THE UNION STOVE REPAIR COMPANY, 2854 Archer avenue, Chicago, advise us that they are jobbing the Black Jack Paste Stove Polish, together with several other popular brands, and are in a position to supply the trade with any special brand of Stove Polish they desire. The company are also receiving a large measure of encouragement from the trade in general on their Original Stove Repairs.

THE COLE MFG. COMPANY, Stove founders, are about to begin the construction of a new building in connection with their plant at Thirty-fifth street and Western avenue, Chicago. The new building will be three stories in height and extend over an area of 150 x 50 feet. It will be of brick and stone.

At the assignee's sale of the real estate, foundry, buildings and patterns for stove making of the Schuylkill Valley Stove Works, at Spring City, Pa., on November 1, the property was bought by E. B. Colby of New York for \$17,100. The plant is soon to be put in operation, and it is reported that it will either be consolidated with or run in connection with one of the successful plants now being operated in the Schuylkill Valley.

GEORGE M. CLARK & Co., Chicago, are sending through the mails a new price-list of their Gasoline Stoves, taking effect November 1. The price-list is inclosed in a stiff red cover for sending through the mails. A feature of the folder is an excellent view of the company's exhibit of Jewel Stoves and Ranges, which won a gold medal at the Pan-American Exposition.

THE PEERLESS STOVE COMPANY of Chicago have decided to move their plant to South Milwaukee, Wis., and the work of new construction is now under way. It is stated that the company have been purchasing from the Stowell Foundry & Mfg. Company more than 500 tons of Castings, and it is to save freight on this amount of material that they have decided to remove to the source of this supply. The company have been giving employment to about 50 men, and it is stated that after the plant at South Milwaukee is completed the pay roll will be largely increased.

THE SUN STOVE MFG. COMPANY of Detroit, Mich., recently filed a certificate changing the name of the corporation to the Sun Stove Company and increasing the amount of capital stock from \$20,000 to \$40,000.

THE WEIR STOVE COMPANY of Taunton, Mass., have recently acquired the Daniel Sheehan estate on Fourth street, which adjoins their plant. We understand that the business of the company has increased to such an extent as to make additional facilities necessary.

THE recent death of Theophilus H. Smith removed one of the oldest residents of Chelsea, Mass. For many years he was identified with the Stove business in Boston and was well known to the trade throughout the country. Mr. Smith was born in Berkshire, Vt., 84 years ago and went to Boston as a young man. He first engaged in a lathing business, but about 40 years ago he left that to engage in the Stove business. During his career he was connected with the Walker & Pratt Mfg. Company, and later with the Magee Furnace Company. He retired from active business about 15 years ago.

In a green envelope bearing their owl trade-mark, "Be Wise," the Gobeille Pattern Company, Cleveland, Ohio, are sending out a green circular entitled "Artistic Stove Patterns." The circular states that the company are busy with a line of Patterns for a new stove concern, and call attention to the success of the new Stove Patterns they made for the Summit Foundry Company of Geneva, N. Y., and to the fact that the Prizer-Painter Stove Company of Reading, Pa., took enough orders for their new Oak Stove to reimburse them for the \$20,000 order given in one afternoon to the Gobeille Pattern Company for new wood Patterns.

THE HARRIS ACETYLENE STOVE COMPANY, with main office in the Corporation Trust Company Building, Jersey City, N. J., have been incorporated with a capital stock of \$100,000 by John Harris, S. H. Smart and John H. Smart, to manufacture Acetylene Gas Stoves.

THE GATE CITY STOVE WORKS of Catlettsburg, Ky., have been incorporated with a capital stock of \$2000 by J. P. McCloskey, C. F. Wilson and others.

HARRY KING, who is well known to the Stove and Furnace trade, is now filling a responsible position with the American Tobacco Company.

Settlement of Labor Disputes in France.

A report to the State Department from United States Consul Skinner at Marseilles gives some details of interest regarding an organization established in that city by the French Government for the adjudication of disputes between employers and employees. The undertaking appears to be to some extent tentative in its nature. The mission of the new Council of Labor is to give advice upon all questions bearing upon labor; to prepare reports at the request of the Minister of Commerce and Industry; to publish the current and normal rate of wages; to determine the current and normal length of the work day; to seek means of preventing or terminating strikes or lockouts; to prepare reports upon the division of allowances made by the public to institutions of patrons and employees; to investigate and report upon the execution of laws, decrees and orders concerning labor and modifications which might prove beneficial thereto. For the present the Council is only granted advisory powers, the right of ultimate settlement still being left to the established authorities; but the idea is to enlarge its functions in the future.

The Council is formed of three elements—employers, employees and *Prudhommes*, the latter class being members of the *Conseil des Prudhommes*, which has had an uninterrupted existence in Marseilles since the period of the Roman occupation. This body has for its duty the conciliation of differences between employers and workmen. It judges all complaints relative to contracts with apprentices, and in default of express stipulation regulates the amount of indemnity due in case of violation of such contracts. Complaints relative to the accounts of employees, trade-marks and patents are also considered by this court. The *Conseil* is composed of employers and workmen in equal numbers, with a president and vice-president, the members thereof being elected by their fellow employers and employees. The parties to complaints presented to the *Conseil des Prudhommes* plead themselves, without the intervention of attorneys.

In the Council of Labor organized in Marseilles the board of *Prudhommes* is represented, but the majority are members elected from the various syndicates of employers and workmen. The syndicates of employers must have at least ten members to cast one vote, and these syndicates elect employing councilors. Syndicates of employees must have at least 25 members to have one vote in selecting employee councilors.

One of the most ludicrous mistakes made by the telegraph was caused by the loss of a single dot in a telegram from Brisbane, Australia, to a London news agency, says the *Telegraph Age*. As it reached London it read: "Governor-General twins first son," which the news agency "edited" and sent around to the papers in the following form: "Lady Kennedy, the wife of Sir Arthur Kennedy, Governor-General of Queensland, yesterday gave birth at Government House, Brisbane, to twins, the first born being a son." The telegram arriving in the small hours of the morning, there was no time to check it or refer to Debrett, and it was published by most of the newspapers in London and the provinces and caused an unexpected sensation. Sir Arthur's friends pointed out with conclusive force that some one had blundered, as there never was a Lady Kennedy, Sir Arthur being a bachelor. The repeat message, which followed, read: "Governor-General turns first sod," referring to a railway ceremony.

National Meat and Food Chopper.

The National Specialty Company, Philadelphia, Pa., for whom Warner & Rucker, 88 Chambers street, are the New York representatives, have just put on the market the National meat and food chopper, as here illustrated. It is made in sizes Nos. 1, 2 and 3. The No. 1 is the popular size for family use, No. 2 being somewhat

National Meat and Food Chopper.

larger and of the same general style, while No. 3 is equipped with legs so that it can be screwed to bench or table, for the use of butchers, clubs, hotels, restaurants, &c. This chopper has four separate cutters for pulverizing and chopping various food products, cutting meat, &c., coarse, medium or fine, according to the nature of the material treated. The manufacturers dwell particularly on the simplicity of this chopper and the ease with which it can be cleansed after use. The worm screw spindle which forces the material against the knife is fastened to the handle with a recessed screw. The thumb screw at the left, which holds the knife in position, works against an end piece which has a bayonet catch top and bottom, and is held in place by a hinged piece of metal, that holds it securely in position. The curve of the standard enables a vessel for receiving the material cut to be pushed well under the delivery point. Attention is also called to the improved clamping device. The whole machine is covered with a coating of pure tin.

Oil Lamps and Heaters.

Edward Miller & Co., Meriden, Conn., and 28-30 West Broadway, New York, have now on exhibition for this season's trade a large line of especially fine new lamps for exacting city trade, which must be seen to be appreciated. Some are in patina or old brass, others in carmine red with old brass trimmings, still others being in Nubian finish with similar trimmings.

In more moderate priced goods are shown table lamps with vase in old brass and trimmings of wrought iron. There are likewise several new lines of reception lamps in a number of new finishes in shaded tints so priced as to meet a popular demand.

In the construction of their line of oil heaters, they have incorporated the simple wicking device brought out recently in the Ideal student lamp. This recent improvement, they believe, will surely overcome any possible objection to oil heaters. There are other improvements in connection with these goods, however, one of which is that the bases are now stamped from steel instead of being cast iron, the effect of which is to remove the danger of breakage as well as to reduce the weight, which is especially important in shipping abroad.

The Schroeder Rotary Washing Machine.

The rotary washer herewith shown is offered by the Benbow-Brammer Mfg. Company, St. Louis, Mo. The tub of the machine is made of red Louisiana cypress. All iron parts coming in contact with the clothes are galvanized, while the castings are handsomely finished in colors. It is referred to as having a tight fitting lid,

allowing no steam to escape; also as running forward or backward easily. The working parts are always in gear. It is remarked, and there is no sudden jar in reversing. There is an absence, it is stated, of clutches, springs, triggers or other devices which might break or get out

The Schroeder Rotary Washing Machine.

of adjustment. The washer is made in several styles of tubs.

Nickel Plated Towel Racks with Glass Bars.

Searls Mfg. Company, Newark, N. J., are putting on the market towel racks with glass bars, as shown here-

Nickel Plated Towel Racks with Glass Bars.

with. The width from the wall is 5½ inches. The racks are made in two sizes of bars—¾ and 1 inch—in both 24 and 30 inch lengths.

The Pullman Trouser or Skirt Hanger.

In the accompanying cuts are shown a trouser or skirt hanger offered by the Pullman Sash Balance Company, Rochester, N. Y. The hanger shown in Fig. 1 holds four garments; a smaller size is also made. They

Fig. 1.—The Pullman Trouser or Skirt Hanger.

are constructed of one piece of wire, nickel plated, and may be secured rigidly to a door or wall, or if preferred, hung on a hook. As shown in Fig. 2, the garment is suspended between two of the wires, and may be placed in position with one hand. Skirts are hung by the band. Either size hanger can be carried in a suit case or bag when traveling, and thus be always ready for use. The hangers are designed to carry the heaviest garments. The manufacturers mention the following points of ex-

Fig. 2.—Trouser or Skirt Hanger in Use.

cellence: That the hanger takes the bag out of the knees of trousers and puts in just the right amount of crease; that skirts can be held without wrinkling, as the weight is evenly divided on the band; that the hanger saves room in wardrobes and closets; that it teaches method and economy, and that it will last a lifetime.

The T. & B. Fruit Jar Wrench.

The accompanying cut represents a fruit jar wrench offered by the Tarbox & Bogart Mfg. Company, Cleveland, Ohio. The wrench is stamped from sheet steel to render it unbreakable. It will fit any Mason jar cover.

The T. & B. Fruit Jar Wrench.

By the use of the wrench jars can be made air tight, it is explained, and the most obstinate cover can be easily removed with it, without injuring the cover in any way.

The Ideal Sap Spouts.

Charles Millar & Son Company, Utica, N. Y., are offering the sap spouts herewith shown, in open and closed top. They are made in one piece from the best malleable iron, tinned. Each kind is made to fit a hole bored with a 1/2-inch bit. The hook is combined with the spout, and the fluted or corrugated end is designed to admit the sap from all points. The spouts are made extra long so that all of the sap will drop into the bucket, and if necessary two spouts can be used with one bucket. Among the points of excellence claimed for the spouts are the following: That they will not break, that they

Open.

Closed.

The Ideal Sap Spout.

are not liable to clog, that they will thaw out quickly when slightly frozen, that they will obtain a comparatively large quantity of sap from a tree, that they will not injure trees and that they will not drop out or loosen by frost. Both kinds are referred to as being handsomely finished, and are packed in pasteboard boxes containing 250 spouts in all of either kind.

The Boss Internal Gear Washing Machine.

The improved washing machine herewith illustrated is offered by the Boss Washing Machine Company, Cincinnati, Ohio. The improvements embodied are increased leverage, decrease in amount of power necessary to operate it, increased rapidity and no openings for escape of steam. All gearing is inside of the casing

The Boss Internal Gear Washing Machine.

and out of sight. All castings, the fly wheel excepted, are heavily galvanized to prevent rust. It is stated that the castings cannot be broken by ordinary use, in handling or in shipping. All wooden parts are made of Louisiana red cypress, which, it is remarked, is impervious to water. The lower cylinder can be detached instantly from the connecting rod and removed from the machine, allowing the body of the machine after washing to receive thorough cleansing and ventilation. Every

machine is set up complete at the factory, all that is necessary being to attach the fly wheel to the shaft. The makers claim that the machine does the work thoroughly, quickly and with little power, that a child can easily operate it and that it cannot tear the clothes. The machine is made in three sizes—No. 7, for family use; No. 8, for family use, extra large, and No. 9, for hotel and laundry use.

A Paint Display.

Ready Mixed Paints are generally considered hard subjects with which to make pleasing window displays, but Burhans & Black Company, Syracuse, N. Y., have succeeded in producing a most attractive window with them, as is shown in the accompanying illustration. As will be seen, this display was made wholly of cans of Paint of various sizes, together with the material that is used in applying the same, with the exception of the stone steps and the work which represented stone around the fountain, which were made of Washita and other Carpenters' Stones. The spindle work on the bal-

A Paint Display.

cony, as well as the fence at the rear of the fountain, were made up from Brushes of various sizes.

Stove and Hardware Dealers.

THE next annual meeting of the Wisconsin Retail Hardware Association will be held in Milwaukee on the first Wednesday and Thursday of February, 1902. C. A. Peck, Berlin, the efficient secretary of the association, advises us that the association is actively prosecuting its work for the betterment of trade conditions. With very few exceptions the members are paying up their dues, and a keen interest in the association work is manifested. The organization is stronger than ever before, and the next meeting will, it is hoped, show a substantial growth during the past year.

WATT-HARLEY-HOLMES COMPANY, Fitzgerald, Ga., have opened a branch house in Douglas, Ga., and request the trade to send them catalogues relating to Hardware, Stoves, Paints and Sporting Goods, Tinware and Crockery.

J. H. COXHEAD of 851 Ellicot square is designing the new plant for Sidney Shepard & Co. of Buffalo, N. Y. The new plant will be located in the outskirts of Buffalo. Heavy orders for machine tools, presses and special machinery will be placed.

BOHART-MORRIS HARDWARE COMPANY, Harrison, Ark., wholesalers and retailers of Shelf and Heavy Hardware, Stoves, Tinware, Buggies, Wagons, &c., have re-

cently completed a new building. It is of pressed brick, two stories high, and 25 feet wide by 100 feet long. The store is referred to as one of the most attractive in the State.

Russia's Traveling Army Kitchen.

In his report on the Russian troops in China, says the New York Sun, Major Craighill of our army commented chiefly on the "traveling field kitchen," in which the men's soup was cooked while they were marching. This kitchen consisted of a boiler mounted on a special wagon. In traveling by rail, the whole apparatus was put on a flat car, and the cooking was done while the train was in motion. The same wagon seems to have caught the attention of a spectator at the recent Russian maneuvers, who describes it thus:

A large iron vessel, shaped rather like an enormous tea cup, is set upon the axle of a light wagon. In some forms the wagon is limbered like a gun, the limber and driver's seat being hollow to carry supplies. The top of the vessel is covered with a double hinged lid, and is fastened down with screws, and provided with a safety

valve. Below this large boiler an iron fire place is constructed, the door facing to the rear of the carriage, while a chimney 2 or 3 feet high carries off the smoke and insures a draft.

Before the troops move off the men in charge of these wagons fill the boilers with water and put in meat and vegetables. About two hours before camp is reached the fires are lighted, and the dinner begins to boil, so that by the time the troops come to a halt a hot dinner of strong soup and boiled meat is already cooked.

It is true that the use of the kitchen wagon entails a slight increase in the baggage train; but this increase is counterbalanced by the independence which each company possesses if it carries its kitchen, larder and wood store in one light cart. The amount of wood required is far less in an iron grate than in an open or trenched fire. The wagon is inexpensive, but the saving to the men would outweigh a far more expensive contrivance. It is superior to any article of camp equipment now in use in the armies of Europe.

The commissariat of the Russian army is different from ours, in that canned food is practically not used at all. But the commendation given by competent military men to the Russian field kitchen suggests that it might be studied by our military experts with advantage.

Pullman car porters are organizing a bank in Chicago. This will be the second bank in the North to be founded by colored men, the first being now in active operation in Philadelphia. The porters maintain an organization named the United Investment Company, who are operating two business ventures in Chicago, one a furnishing store and the other a cigar store and factory.

The St. Louis Exposition.

The buildings of the Louisiana Purchase Exposition, which will be held in the city of St. Louis in 1903, will occupy a site embracing the unfinished half of Forest Park, said to be one of the largest public parks in the world. The portion to be used contains 668 acres, and about 300 acres of surrounding property will be added so as to bring the total area of the site up to about 1000 acres. The main buildings will be larger, it is stated, than those of any previous exposition, and it is expected that the working drawings will be ready by November 1. The letting of contracts aggregating about \$11,000,000 for construction work on the buildings and grounds will begin about December 1. There is to be an agricultural building, 700 x 2000 feet; a manufactures building, 600 x 600 feet; a liberal arts building, 600 x 1200 feet; a social economy building, 550 x 700 feet; a transportation building, 600 x 1200 feet; an education building, 550 x 700 feet; an art building, 300 x 600 feet, with two wings, each 200 x 300 feet; a mines and metallurgy building, 600 x 1200 feet; an electricity building, 600 x 550 feet; and a Government building to cover 100,000 square feet. The estimated cost of these buildings is \$7,000,000. To these will probably be added buildings for fish and fisheries, for machinery, for forestry and for horticulture.

Severe Test of Fire Proof Construction.

There have been several cases recently in the city of Chicago where fire proof construction has been subjected to very severe tests. Probably one of the most severe was in the eight-story building fronting 180 feet on Market street and 140 feet on Lake street, which was erected about two years ago, and was occupied by a firm of wholesale grocers. The fire originated about midnight by some unknown means in the southeast corner of the first floor in some waste or rubbish which had been swept to that place to be hauled away in the morning. The fire penetrated to a mezzanine story above 23 feet wide and 125 feet long, which was closely packed with wooden ware, including buckets, baskets, tubs and other light articles. These with several hundred barrels of sugar beneath were consumed. Experts estimate that at times there were 2000 degrees of heat at one place, yet notwithstanding the conditions the fire was under control in half an hour. The firemen expressed the opinion that had the building not been of fire proof construction the entire structure and contents would have been destroyed.

The building was designed and erected under the supervision of architects D. H. Burnham & Co. of Chicago, who describe the construction as follows: The foundations of the east wall of the building were built on what is known as the cantilever system, resting on piles. The columns supporting the mezzanine story, which was 7 feet 3 inches in the clear, were of heavy cast iron and were bricked in square. The beams were of cast steel, having a segmental arch of hollow tile fire proofing. The arches were supported by skewbacks, which protected the lower flange of the beam. The floors were of two thicknesses of wood laid in concrete on wooden sleepers. The south end of the mezzanine story was composed of large wire glass transom lights 6 feet tall and the full width. Piled up against these transoms was the burning merchandise, but it is stated that the glass was only cracked.

The loss was adjusted on a basis of \$31,536, and of that amount only \$3869.34 was set aside as the damage to the building. Much of the damage represented by this amount, however, was done by smoke, and by the firemen in getting into the building, as well as in the cleaning up and putting other than the burned section into good condition. Superintendent Tinsley of the firm of architects estimates the value of that part of the building which was really destroyed at \$200, the rest of the loss being attributable to the causes indicated.

In the opinion of insurance men, owners, investors and builders this was a most remarkable test of fire proof construction, and shows what advances have been made in this direction in the last few years.

The Besly Band Polishing Wheel.

An illustration is given herewith of a new polishing wheel which has recently been placed on the market by Charles H. Besly & Co., 10 North Canal street, Chicago. This machine was developed in the firm's own shops. They had found much difficulty in securing expert polishers and were obliged to devise something to meet the emergency. With this machine an inexperienced man of fair intelligence, after a little practice, will be able to do fine work. The wheel is for this reason especially suitable for small shops in which no expert polisher is employed to set up wheels and keep them in order. With this machine the polishing surface can be changed from fine to coarse in a minute or two. The complete machine consists of a pedestal, a countershaft and a spindle to hold either one or two emery band polishing wheels. These wheels are made of cast iron. An elastic surface is produced by a felt covering. The emery or other abrasive material is a piece of emery cloth, which

The Besly Band Polishing Wheel.

is tightened firmly around the wheel. To reset the wheel or change the grade of emery it is only necessary to remove a band and replace it with another. It has been found by the experience of the firm that these wheels are no more expensive than solid emery wheels. The machines are also made with one wheel mounted on the spindle, with the other end of the spindle suitable for buffing, and are furnished with cushioned or with a hard surface.

Statistics compiled by Julius Pintsch of Berlin, Germany, and the Safety Car Heating & Lighting Company of New York, show that up to the end of last May 105,664 cars were equipped with light by the Pintsch system of compressed air gas, being an increase for the year of 7482 cars. At present there are in operation 336 plants for making or compressing the Pintsch gas, being 30 more than in the previous year. In addition to the railroad use of compressed gas by the Pintsch system, 1162 beacons and bouys are so lighted.

What is claimed to be the largest sheet or plate glass ever made in this country has just been turned out at the factory of the Pittsburgh Plate Glass Company at Elwood, Ind. It is 145 x 221 inches in size.

THE WATER METER AS A SANITARY AGENT.*

The value of the water meter as an aid in husbanding scanty water supplies and postponing the day when additional pumps, larger mains and more capacious reservoirs will become imperative is fully appreciated by most water works men. Members of the same class, as a rule, also appreciate the fact that the water meter is the most equitable and reliable means of apportioning the cost of public water supplies between private consumers. But neither water works superintendents nor any other class of city officials have more than begun to realize the possibilities of the water meter as an aid to sanitation. As for the general public, and even large numbers of health officers and other sanitarians, the water meter is commonly looked upon by them as a sanitary evil rather than a sanitary necessity. In fact, nearly every one who has introduced or tried to introduce the meter system knows only too well that the strongest opposition encountered often centers around the plea that meters are a menace to health because they cause people to skimp in the use of water. The weakness of this and other assertions that meters are unsanitary has been repeatedly shown, but so far as I am aware no one has considered the water meter from the single standpoint of its beneficial relation to the public health.

The chief sanitary benefits which result from the use of water meters are:

1. Pure water supplies.
2. A wider and freer use of public water supplies.
3. The extension of sewerage systems and their introduction into the smaller cities and towns.
4. More money rendered available for other sanitary improvements.

1. The need for purer water can scarcely be overestimated. Typhoid fever alone, a large percentage of which is due to impure water, claims its thousands of lives every year. Besides this disease many other minor ailments and much poor health are due to unwholesome water. The indirect damage to health resulting from water which is so muddy or otherwise unpleasant as to discourage rather than encourage its use for bathing purposes cannot be estimated.

The rapid increase in water consumption on the one hand and the equally rapid pollution of water supplies on the other renders the problem of securing pure water more difficult every year. The growing appreciation of the dangers of polluted water supplies, welcome as it is, adds to the perplexities of those charged with the administration of water works plants. As the consumption and waste of water mounts up, the choice gradually narrows to some distant source of supply or the purification of water from some nearby source. Even if the former is chosen the chances are that sooner or later purification will be required.

The greatest obstacle to any improvement in the character of water supplies, whether by purification or going further afield, is the large volume required to meet present demands and the far greater quantity that must be provided to keep pace with the increasing use and waste. The consensus of opinion on the part of all who have given careful attention to the subject is that waste, not use, is chiefly responsible for the leaps and bounds in water consumption, and that the waste may be curtailed, often to the extent of cutting the total consumption in half, by the use of meters. If this be true, and I am firmly convinced that it is, then the water meter may be made one of the most efficient sanitary agents of the century. Its universal introduction would go far toward solving the problem of providing pure water to every city dweller in the country.

Incidentally the meter system would aid in the struggle for pure water by diminishing the amount of sewage and thus simplifying and cheapening its final disposal without polluting some water supply. This in itself is a strong argument in favor of the use of the meter.

2. A wider and freer use of public water supplies would follow the universal meter system. The reduced cost of the smaller supply, both in construction and operation, would make works feasible in many places now without them and would aid in extending existing plants to sparsely settled districts. In all except the larger cities of the country there are many people living on streets provided with water mains who continue to use private wells, often badly polluted, rather than pay a yearly rental for water. Reductions in this rental, made possible by the use of meters, would encourage the abandonment of wells.

In addition to the foregoing considerations, and in some respects still more important, the meter system would extend the use of water by people of moderate

means and by the very poor, many of whom under schedule rates have access to but one faucet for drawing water. That faucet is located over the kitchen sink or in some common hallway or yard. Cold water is all that can be drawn from it, which materially lessens its use for sanitary purposes. Now, meters not only tend to lower water rates through the saving in water already noted, but they make possible a complete readjustment of the cost of water service. First they make it easy to place the cost of fire protection, street sprinkling and water for public building in the general tax levy, or to assess it upon the real and personal estate and the several public departments directly benefited. This would naturally lessen the portion of the cost of water service which would fall upon the private consumers. The water meter would then distribute the cost of private service, not according to the number and kind of plumbing fixtures a family happens to have, but in proportion to the actual amount of water which it uses and wastes. By means of this reduction and equalization of the cost of domestic service a family which, under fixture rates, could afford only a cold water faucet at the kitchen sink, might under the meter plan at no additional expense have a bathtub and other fixtures with hot and cold water, and perhaps a water closet besides.

3. The relations between water supply and sewerage are so intimate that what favors the introduction of one ought always to favor the others as well. All small, and an increasing number of large, towns are being seweraged on the separate plan—that is, one set of conduits removes household wastes, or sewage proper, and (but often not till years later) another set is provided for the removal of storm water. Obviously, the less the water consumption the less will be the sewage and the smaller may be the pipe system. If the sewage is either pumped or purified any decrease in amount is doubly welcome. The net effect of the use of meters on the sewerage system is to reduce its cost, and thus to make it more readily available to all cities and towns and to all people in each city. The introduction of sewerage systems, and their use after being introduced, is far less general than is the case with public water supplies. Moreover, many people defer water connections until sewer connections can also be made on account of the well-known cesspool nuisance. The sanitary benefits of sewerage connections with the abolition of privies and cesspools are too obvious to need exposition here.

4. Thus far the water meter has been considered in relation to the public through the water works and sewerage systems. Important as these facilities are, it should not be forgotten that every dollar that can be saved through the use of meters is urgently needed for the sanitary betterment of the city in other particulars. Water supply, very properly, has always ranked first among municipal public works. But hundreds of American cities are spending money in a vain struggle to keep pace with increasing water consumption and waste, which, under a proper meter system, would be available for such sanitary needs as improved methods of sewage and garbage disposal, sanitary pavements, healthful school buildings, efficient health board work, and ample parks and playgrounds.

New Boiler Plant at Buffalo.

The American Radiator Company have acquired 25 acres of land on Hertel avenue and the Delaware, Lackawanna & Western tracks, in the northern section of Buffalo, N. Y., where they are about to erect a new plant devoted exclusively to the manufacture of cast iron house heating boilers. A portion of the equipment now employed at the Michigan plant of the company in Detroit will be transferred to the new plant as soon as it is completed. The buildings, for which contracts have been let, will be of brick and of permanent construction.

During the past two years several new types and sizes of boilers have been brought out by the American Radiator Company, and it is contemplated to add to their already extensive assortment. On the completion of this new plant a more satisfactory distribution of facilities for the production of boilers will have been accomplished, which will enable the concern to consolidate shipments of boilers with radiators at both Buffalo and Detroit. It is planned to have the plant ready for operation by next summer.

H. W. JOHNS MFG. COMPANY, 100 William street, New York, are distributing a pamphlet describing their Asbestos Fire Felt Coverings for steam pipes, boilers, &c.

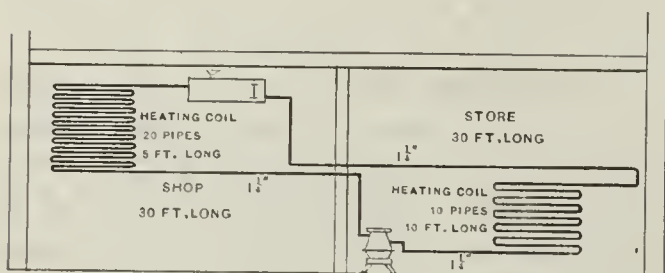

* Paper read by M. N. Baker of New York City at the eighth annual convention of the American Society of Municipal Improvements, at Niagara Falls, N. Y., October 24, 1901.

A FREAK, BUT IT CIRCULATES.

BY A SALESMAN.

In traveling among the steam and hot water heating trade a salesman meets with many peculiar views as to how a job should be piped, and the plants that are seen, in many instances, are peculiar, to say the least. Many men would save themselves trouble if they would recognize the fact that the sooner the hot water from a boiler reaches the highest point in a system the better it will circulate. Modifications of this general principle, of course, would be needed to meet special cases. Where circumstances will permit, if the main from the boiler is carried to some high point and the branches are distributed from it, the water will cool and fall and the circulation will be better than if a reverse method is followed. Now, notwithstanding this, there are many plants in operation which are not piped in accordance with this principle.

I recently visited a plant which was piped as shown in the sketch herewith. It was used in the store and shop of a plumber and steam fitter. A small tank heater was placed in the store, and a $1\frac{1}{4}$ -inch pipe was carried from the flow connection to a coil made of pipes of the

A Freak, But It Circulates.

same size, consisting of 20 in number, each 5 feet long. From the top of the coil a pipe was carried over to an expansion tank made from an old kitchen boiler and placed near the ceiling of the shop and provided with a funnel for filling it. It was also tapped so as to have a gauge glass for showing the amount of water in the system. From the opposite end of this expansion tank from the opening that is ordinarily used as the cold water connection to the boiler, a $1\frac{1}{4}$ -inch pipe was carried to the extreme end of the store and then carried back to a coil made of 10 pipes 10 feet long. From the lower end of this coil a return was carried to the tank heater.

The fact that this system was circulating satisfactorily and heating the building goes to show that water will circulate even if systems are not arranged in accordance with what most men consider the best practice. Nine men out of ten who have had any experience in hot water heating would have carried the flow main from the tank heater up to a point near the ceiling and have branched each way to supply the radiating coils. A small pipe would have been taken from the highest point on the flow main and carried over to the expansion tank and connected so as to allow the air to escape from the piping system. The pipe from the expansion tank should have been carried to the return main on the tank heater, in the case illustrated. In the system shown it is my opinion that the success is due to the large coil on the return end of the system. When the water in the lower coil cools and becomes more dense it naturally falls to the tank heater and makes room for warmer water to flow around and fill the space it formerly occupied.

The Modern Spray Bath.

The Workingmen's Club of Hartford, Conn., were recently entertained by Dr. E. K. Root, who lectured on the advantages of the modern spray bath, with a view of increasing the interest in public baths. He pointed out that there was a tonic effect from the spray bath that was very valuable in stimulating the skin and thus providing protection against subsequent exposure, particularly when the temperature of the water is gradually

lowered as the bath continues. The low cost at which the spray bath can be given, the speaker said, especially adapts it to success as a popular bath. Attention was called to the fact that the basement of public schools could be very readily fitted up with spray baths, with great benefit to many school children. The cleanliness of the spray bath was compared with that of the ordinary bathtub, and a comparison in its favor was made in the cost of the apparatus. This is a question in which all plumbers are interested. They can lend their assistance to the extension of the use of public baths with benefit to the community and profit to themselves.

Acetylene Gas Abroad.

In compliance with a request from the Treasury Department United States Consul Kehl, writing from Stettin, Germany, reports as follows regarding acetylene gas abroad:

Acetylene gas is emerging from a crisis which almost retired it as an illuminant. About eight years ago, when this gas was in its infancy, numerous devices for its manufacture sprang into existence; but through ignorance and improper constructions many fatalities resulted. The press denounced its use; the police authorities throughout Germany placed almost prohibitive restrictions upon acetylene generators; the preparing of liquid acetylene was strictly forbidden; insurance companies protected their interests by high rates and special requirements in addition to those prescribed by the police. As a result only safe and meritorious machinery is now constructed.

The advantages claimed for acetylene gas are many. It is the nearest approach to sunlight, with a power said to be 15 to 20 times as great as ordinary coal gas, and with six times less heat when used for illuminating purposes. For the manufacture of gas producing contrivances and the various acetylene burning devices Germany has about 235 factories, the most important being the Allgemeine Carbid und Acetylen Gesellschaft, Berlin. This concern manufactures everything in the line of acetylene producing machinery and the different gas consuming articles.

The imperial testing station for marine lights, situated close to Stettin, has officially tested the lighthouse burner and reflector manufactured by the firm above named. The chief of the station, in a personal interview, expresses himself as follows:

For lighthouses out of reach of electricity, and easily accessible in winter or summer, acetylene would render good service, although it can in no way be compared with electricity in reliability, on account of the many details which must be looked after when burning this gas. I prefer electricity. Most of the French coast lights are electrical, while our lights are all petroleum.

At the Altenbruch lighthouse, on the Elbe, there have been some experiments with acetylene, giving the following results: By a consumption of 102 liters per hour 302 candle-power was produced and by 175 liters per hour 435 candle-power. An objection to acetylene for "long range" lighthouses, as advanced by an experienced sea captain, is that in a fog or thick weather it "walls" too easily. A petroleum light will penetrate a fog to a greater distance than any other illuminant. For clear weather acetylene probably gives the best results. In the Stettin district there are 15 navigators' lights, five of which are burning acetylene; one, on an artificial island in the Oder River, is to be replaced by electricity, due to the difficulty of approach during the period of ice.

The acetylograph is a portable search or signal light for army use and can be used by day for signaling purposes. This apparatus, carrying its own generator, is mounted on three legs similar to those of a camera. The hand search light for the hospital or medical corps has a small generator attached to a belt and connected with a reflector by a hose about 3 feet long.

United States Consul Bergh reports from Gothenburg, Sweden:

In this consular district acetylene gas has not yet come into use in lighthouses, for buoys or for beacons. Acetylene gas is used on several Swedish steamers for the top light, the side lanterns and for search lights. It has recently come into use at several railroad stations and favorable reports have been made. The gas is, furthermore, used in carriage and bicycle lamps and hand lanterns in factories, and for small cooking and laundry stoves. It is considered that acetylene would also be adapted for lighting large country estates, churches, hotels, &c.

There are in this city two concerns which manufacture the apparatus, but only a few have yet been ex-

ported. I have also seen here appliances of foreign manufacture. Calcium carbide—used for the production of acetylene gas—is manufactured in Sweden. The largest factory in this part of the country is probably the one at Trollhättan, some 50 miles from this city. I am told that calcium carbide is exported chiefly to Hamburg, but also to Japan and adjoining countries. At present the price of calcium carbide is 20 kronor per 100 kg. (about \$2.43 per 100 pounds) at the factory.

According to calculations made by the manufacturers of acetylene works the use of the gas is economical, especially in this country, where petroleum and coal are considerably more expensive than in the United States. It is calculated that a factory using 50 lamps at 16 normal candle-power each, burning 720 hours per year, would have the following yearly expenses for lighting:

Using petroleum, refined, at present price	\$149.97
Using coal gas in common burners	291.85
Using electric incandescent lamps	236.88
Using acetylene gas	125.53

These calculations are based on the average price of gas and electricity and counting calcium carbide at 27 kronor per 100 kg.

If certain regulations are complied with and the gas works are of a type approved by the insurance companies, the latter do not make any discriminations against persons or business firms who use acetylene.

THE FAULT OF THE BOILER.

BY A. T.

It is to the credit to the manufacturers of the modern perfected boiler for house heating purposes that it has so few defects that would tend to interfere with its general operation. That some boilers could be more economical is plain to any one who has made a study of this type of heating apparatus, and it is also true that others could have some of the details of their equipment simplified so as to enable them to be more easily set up by the heating contractor, thus effecting a saving in time and cost. The time has entirely passed, however, when the constructions placed on the market by the older houses have such defects as will interfere with their operation when properly set up and connected with a piping system properly proportioned and run. Nevertheless, to many boiler houses comes the complaint from the heating contractor that the boiler last purchased and set up does not give satisfaction. Complaints of this kind are often of a general character, and are rather exasperating under the circumstances, especially when any attempt to secure further information or details as to what might in some way cause the trouble only brings forth another general statement that "the work has been done all right and your boiler does not come up to its rating," with a suggestion that the sooner a man is sent to see what is the trouble with the boiler, the better for all concerned.

Every boiler house has in its employ some one of enough engineering ability to look over a heating system and locate the trouble, and many times a man is sent who is really master of his business. Sometimes the surface in the piping system is not included in the amount of radiation which the boiler has to carry, and in consequence a smaller sized boiler is selected than is needed for the work. The boiler manufacturer cannot be responsible for this. Nevertheless the expectation prevails with such customers that the makers will give their support in making what changes may be necessary. Sometimes when the boiler has sufficient capacity the job is "shy" on radiation, as it is expressed in the trade. Consequently the building cannot be heated, no matter how hard the boiler may be fired or how well arranged the piping may be. Again, the arrangement of the piping system in some cases is such as to lead to the interference that there was no intention that the heating medium should reach the radiators without overcoming friction and other unnecessary impediments. Attempts are made to combine single and two-pipe systems and circuit systems in such a way as to nullify the benefits of either. Valves are sometimes so placed as to interfere with the operation, and air valves are either omitted from the system or placed where they cannot be of any practical use. The failure of some of the radiators to heat because they are filled with air is sufficient for a broad condemnation of the boiler and the occasion for a

visit from the manufacturer, no matter how distant his plant may be, to point out this or some similarly simple trouble. Radiators are often so connected that they become filled with water on steam jobs and interfere with the carrying of a steady water line in the boiler. Often a window is left open so that the cold air can blow on a steam radiator, thereby condensing the steam as fast as the boiler can make it, and interfering with the heating of other parts of the house.

The defects above enumerated are only a few of the many simple causes of trouble which the steam fitter insists are caused by the boiler. Acting upon this assumption, he claims that the manufacturer should see to it that his goods are properly constructed and tested before they leave his factory, and demands that he send a man to remedy the defects, which interfere with the steam fitter's business by causing his customer to become dissatisfied. Every manufacturer is willing to lend his assistance wherever it can be of benefit, and this fact induces some steam fitters to impose upon him. The willingness to give aid, however, merits in return an effort on the part of those seeking assistance to describe their troubles in such a way that a remedy can be pointed out without the loss of time and the expense incurred in a visit to the point where the trouble exists. It will take but little time to go over any troublesome job and make a complete rough sketch of the piping system in the cellar, with a plan of the upper floors, the location and size of the radiators, the sizes of the pipes leading to and from them, with the method of making connections, and the location of valves. In fact this work, if carefully done, will in many instances enable the steam fitter himself to locate the cause of the trouble and apply a remedy without further assistance. Even if he is unsuccessful, it will certainly qualify him to more readily understand any plans, drawings and written instructions that he may receive for overcoming troubles which he may report.

I am satisfied that manufacturers will agree that I am not too severe, and that neglect to follow this last suggestion is due in many instances to pure and simple laziness, so that the demand for assistance is an imposition. Such men as those referred to fail to appreciate the fact that the assistance they demand is purely a favor, in no wise due to them, and that the manufacturers are only impelled to assist them in order that the reputation of their goods may not suffer. The steam fitter is paid a profit, to which he is only entitled when he understands his business sufficiently well to do his work in accordance with suggestions that may have been given so that his customer will have no cause for complaint. The manufacturer will make every effort to fill the orders of such a one promptly, even during the busy season, when there is a greater demand for goods than can be readily supplied. In the midst of the season, when there is naturally a shortage of goods, it is only natural that the boiler maker will send goods more readily to those customers who are not in the habit of laying all sorts of faults to the boiler, but who understand their business and set up boilers so that their good reputation is extended.

The P. and S. S. League.

The feature of the bowling tournament of the Plumbing and Steam Supply League at the Monarch alleys, New York, on Monday night was the first defeat of the team of Behrer & Co., who were beaten by the Salesmen team, the latter winning both of their games. The team of F. Adee & Co. suffered defeat by the Salesmen and also by the Behrer & Co. bowlers. On Thursday night the team of F. N. Du Bois & Co. scored two victories, Charles W. Frean making a score of 202. The team of Thomas G. Knight received a double dose of sympathy, and the team of H. P. Read Lead Works experienced both delight and despair.

On Monday night A. Behrer soared aloft with a score of 192, then came down with a dull thud to 95, and on Thursday night C. W. Frean dropped to 110 after his feat of 202. The first game on Thursday night was very close, when the Knights with 675 succumbed to the Lead men with 677. The interest in this tournament has made

it quite a social event in the trade, and many of the older members have dropped in to shake hands with the bowlers and to join in the shout over good plays.

LEAKS.

BY PLUG.

They builded a tower to shiver the sky, and wrench the stars apart,
Till the Devil grunted behind the bricks, "It's striking, but is it art?"

—*"The Conundrum of the Workshops."*

In January last the manager of a large estate came into our office in a desperate hurry and asked that some one go with him to one of their houses to diagnose the case of a steam boiler gone suddenly out of commission. The weather was so cold that it was out of the question to take time to put in a new boiler, and it must be fixed on the spot somehow.

His ground certainly seemed to be well taken, when it was considered that the tenants were of that class who seize on any pretext to move out and leave a quarter's rent overdue. "Must bluff 'em through the winter somehow," he pleaded.

I found the boiler to be an upright tubular, very dirty as to tubes, and neglected looking withal. After rummaging about the fire box for some time with a poker, I discovered a hole in the O. G. flange of the inner shell, at the bottom, and the iron so thin about it that it was easily enlarged by simply twisting the poker. I explained to the manager in carefully chosen words the utter hopelessness of doing anything with it. Then I qualified that by saying it was possible to patch it, but that it would take as long to do that as to put in a new boiler, and after it was done I could not guarantee the job, for I didn't know where it would break out next. I thought the time would be better employed putting in a new one. I then explained that the boiler must be disconnected and laid on its side, to get at it properly; would take two days to do it, and I again repeated, with emphasis, we could not guarantee it; probably start some other holes handling the boiler.

"How long will it take you to put in a new one?"

"Two days," I promptly answered.

Evidently he had been there before, for he almost snarled back at me. "Yes, two days after you get it." Then with new inspiration, he said, "Can't you plaster or brick it up?"

Seeing that further discussion was useless, and finding myself getting warm under the collar talking to him, I said I would call him up at his office in half an hour, and tell him the best I could do. (Thought it easier to surrender the job over the wire than waste time jawing about it there.)

In going back to the shop I made up my mind that if anything could be done we had one particular man who could do it. So I laid the facts before him, to act on as he saw fit.

He gave me a pitying smile as he remarked "That's easy. I'll fix that up before dinner." I asked no questions, but let him go his way. He called on the manager on his road, and told him not to worry. At 3 o'clock he was back at the shop, job finished, steam up and everything lovely.

That boiler ran through the winter without interruption, and, like the seven-leagued boots, is running yet. The manager says he isn't worrying, so long as we have that man about.

What had he done? Merely cleaned the sediment and scale from inside the hole, sludged some Portland cement into it, and protected that on the outside with a piece of fire brick, bedded in more cement.

Surely many fitters would exclaim with our friend, the Father of Critics, "It's striking, but is it art?"

A DIAMOND STUD was the token of esteem which the employees of the Buick & Sherwood Mfg. Company of Detroit, Mich., presented to the retiring president of the concern, D. D. Buick. Thomas D. Buick also leaves the company, and a diamond stick pin marked the affection of the men who have been working under him. The utmost good will of the 375 employees is with both gentlemen. It

is said that they are about to form another concern to manufacture a similar line of goods to that turned out by the old company, now controlled by the trust. The new plant will be situated near the present factory. Mr. Buick has been for 14 years in charge of the Buick & Sherwood plant.

The Oster Pipe Threading Machine.

The Oster Mfg. Company of Cleveland, Ohio, are introducing a new pipe threading machine for bench use, and also one for power with hand attachment. The former, which is here illustrated, has a capacity of $\frac{1}{4}$ to 2 inch pipe. It has an expanding die head, which is graduated on the face plate. The quick opening dies are controlled instantly by a simple cam movement, without the use of screw driver, wrench or other tool. By the use of an adjustable positive stop the operator is enabled to cut any number of duplicate threads with perfect accuracy. The dies are adjustable to all variations in pipe and fittings. The vise is made to center

The Oster Pipe Threading Machine.

the pipe perfectly, thereby insuring straight threads. The pipe is drawn up to the dies by hand wheel, rack and pinion.

Thermometers and Hot Water Pipes.

Although the hot water thermometer is a very inexpensive appliance and serves more than one useful purpose, says the *Ironmonger*, it is employed to a far less extent than it might be. It is scarcely applicable to domestic hot water supply pipes, as the temperature in a pipe does not indicate with any certainty what the temperature at a tap will be, nor can it indicate what quantity is available at any temperature. It is in heating circulations that the thermometer is useful. In the first place, the attendant can see what his fire is doing, and after a few days the action of the thermometer will tell him many little things much plainer than the application of the hands to the pipes can do. A thermometer will also indicate pressure, for this and temperature run together, although normal or low pressures will not be registered as with an altitude gauge. It is high—excessively high—pressures that will be shown, for they are accompanied by abnormally high temperatures, and the thermometer will indicate these. A particularly useful purpose the thermometer serves is in admitting of correct heat regulation in the rooms. Scarcely two winter days are alike in coldness, and the boiler attendant has nothing to guide him in regulating the damper and the fire. With a thermometer he can in a week learn to what temperature to limit his water on the various kinds of winter days, and an occasional glance at this heat indicator will show whether the fire and damper need attention. The thermometer is the next best thing to an automatic heat regulator; it automatically indicates, and a skillful attendant can do the rest.

At a large London club the hot water apparatus has three thermometers, one by the boiler, where the stokers and engine attendants are; the others are fixed where the chief engineer most frequently passes. The latter personage each day gives out the temperature at which the water is to be kept (unless the weather changes and further orders are given), then the stoker keeps his eye on his thermometer while his chief occasionally checks him upstairs.

The Mueller Heaters.

The L. J. Mueller Furnace Company of Milwaukee, Wis., have prepared for distribution among the trade, to increase the sale of their high grade heating apparatus, a hanger 28 x 40 inches in size. The hanger consists of highly finished paper mounted on a cloth back, the top and bottom being protected by metal binding. It is printed in two colors and presents broken views showing the internal arrangement and construction and water and fire travel of their hot air furnaces, combination air and water heaters, and steam and hot water boilers. The hot air furnaces are made for both wood and coal and are all of cast iron construction with steel plate radiators. A special furnace for school and church heating is designed for brick casing, arranged to burn either coal or wood, and to have a long fire travel so as to utilize, as far as possible, the heat of the products of combustion. The boilers are made both horizontal and vertical sectional, arranged to effect a long fire travel and to present a large surface to the fire. The hanger is well calculated to attract the attention of visitors to the store of the heating contractor, and should prove valuable as a means of explaining the features of merit to the prospective purchaser.

THE FREEZING OF ACETYLENE APPARATUS.

In the Acetylene Notes which have appeared in our columns, says the *Ironmonger* of London, repeated reference has been made to the dangers accruing from the freezing of acetylene apparatus. We again draw the attention of those of our readers who possess or sell such plant to this matter, for, neglecting the explosions which have been produced by meddling with a generator in presence of a naked light, by far the majority of accidents on the Continent have arisen through the freezing of the apparatus, followed by injudicious attempts to thaw it. As we have had no winter to speak of for three or four years, we are naturally apt to overlook danger from frost. All large domestic installations ought to have some provision for warming the generator shed systematically with hot air or water pipes, the heater being placed outside. Quite small nonautomatic plants may be protected with glycerin or calcium chloride in the holder seal, the generator vessel being emptied before evening. Automatic apparatus may with advantage be thickly lagged or charged with calcium chloride solution, but this is not altogether satisfactory. In the absence of proper heating arrangements, or upon an emergency, fresh hot stable manure may be packed round all the apparatus. Washers, water seals and governors may freeze as well as other vessels. If the plant freeze, nothing more drastic than boiling water ought on any account to be employed to thaw it, and the operation should be conducted by daylight, with an outside lamp, or with a Davy lamp inside the shed. No apparatus can be emptied of gas even for days by the opening of all cocks and trusting to diffusion. This proceeding only increases the danger by producing a definitely explosive mixture in the holder and mains of the plant. The use of red hot poker or glowing coal for thawing purposes is little short of criminal.

The principal interest in the above article will be in finding a simpler and more practicable method of avoiding the risk of the freezing of acetylene generators. This risk is far greater in the United States, where the temperature in winter goes regularly down to points seldom or never reached in England. In our severe climate generators are placed in specially built cellars or the regular cellars of buildings where even in a severe spell of cold weather the temperature seldom gets as low as to register 6 degrees F. In consequence it has been the custom of many acetylene men to fill the generators of their customers with a saturated solution of salt water, which, it is claimed, will not freeze until a temperature of 6 degrees F. is steadily maintained for some time. Experts claim that the salt water in no way interferes with the generation of acetylene from the calcium carbide. This method of avoiding a freeze up is much simpler than those suggested in the above article, although the necessity for care in thawing out in case of a freeze up is none too emphatically presented.

GEORGE SCHLESLER, Mansfield, Ohio, secured the contract for a new central heating station at the Wittenberg College in that town.

Heating and Plumbing Notes.

EX-ALDERMAN MAHL, who has conducted a plumbing business in the Sigourney House Block, Hartford, Conn., for 20 years, has taken one of the newly arranged stores in the Eggleston Building, which is being fitted up with a fine display of plumbing materials and provided with a convenient office.

HORN & HARDART are erecting at 831 Filbert street, Philadelphia, a seven-story building, to cost \$40,000, which is to be heated with hot water and will have a complete plumbing system.

N. YAMAMOTO of Tokio, Japan, is in the United States for the purpose of securing materials for a building which the Crown Prince of Japan is erecting in his native city. After spending some time in New York, he visited Milwaukee for the purpose of witnessing the manufacture of some of the plumbing goods which he had purchased.

BENJAMIN F. BARBOUR, Third avenue, Birmingham, Ala., is adding a new branch to his plumbing business. He will make a specialty of Gas and Electrical Lighting Fixtures, of which he is now making a fine display. Mr. Barbour has also in hand a number of important heating and plumbing contracts.

A NEW heating system has been installed in the McGowan Hose house, Troy, N. Y., by Albert McCoubrey of that city.

THE new Examining Board of Plumbers of Pittsburgh, Pa., has been organized. It consists of A. J. Pitcairn, John M. Addy, William T. Taggart and James L. Ewing. Mr. Pitcairn was elected chairman and Mr. Addy secretary. Applications for examination must be filed with the Division of Plumbing and House Drainage. Heretofore an average percentage of 65 passed an applicant; now it is to be 75 per cent.

THE master plumbers of Delaware, Maryland, Virginia and the District of Columbia will hold a convention at Norfolk, Va., on December 9.

EDWARD QUINN has been appointed supervisor of plumbing in St. Louis, Mo., and Curtis Hill second assistant civil engineer in the sewer department of that city.

THE PAWTUCKET STEAM & GAS PIPE COMPANY, Pawtucket, R. I., have a contract for plumbing the Pawtucket Institution of Savings.

S. L. HINCHCLIFFE, New Britain, Conn., is installing a Richmond Heater in the residence of George Elliott in that city.

THE steam fitters' helpers of St. Louis, Mo., who have been receiving wages at the rate of \$2 a day, have struck for an advance of 50 cents. The steam fitters in some shops have acted in sympathy with them, while in others the employers have met the demand and their shops are working.

THE NORWALK HEATING & LIGHTING COMPANY, Norwalk, Conn., are installing a Kelsey Generator in St. Mark's Episcopal Church of that place and another in the residence of Mrs. Henry Ogden.

S. E. DIBBLE, New Haven, Conn., is installing a Hub Heater in the residence of B. J. Harrigan at New Haven. He also has a contract for plumbing and heating in the new school house at Whitneyville, Conn., and will use a Hub Heater.

THE Master Plumbers' Association of Binghamton, N. Y., was incorporated on November 1, with the following directors: Frank P. Kelly, C. E. Boughton, William Liddell, W. H. Morland and V. W. Hadley.

THE journeymen plumbers of Sharon, Pa., have gone out on strike, demanding that apprentices now employed shall be compelled to work four years before they are allowed to handle tools.

M. T. ENDICOTT, Chief of the Bureau of Yards and Docks of the Navy Department, will receive bids until November 23 for a steam heating system for the boiler and work shops at the League Island Navy Yard at Philadelphia.

THE records of the Bureau of Building Inspectors of the city of Philadelphia, Pa., show that city permits were taken out during the month of October for the installation of heating plants at an aggregate cost of \$70,120.

THE MUELLER MFG. COMPANY, Decatur, Ill., manufacturers of Water and Gas Tapping Machines, &c., are rearranging their plant for the more economical production of their goods. Among the notable changes is the building of a new foundry building. The capacity will not be increased and they will require no new equipment.

THE BIRMINGHAM PIPE & CASTING COMPANY, Birmingham, Ala., who were organized in January, 1900, have just completed very extensive improvements in their plant and are now prepared to furnish the legitimate jobbing trade a full line of Soil Pipe and Fittings.

RIDGEWAY & TYLER, Albany, N. Y., have completed the installment of a heating apparatus in the new chapel of the Presbyterian Church, at Rome, N. Y.

A SLIGHT damage, covered by insurance, was done by fire in the plumbing establishment of J. F. Sheehan, 125 Madison avenue, Albany, N. Y., last week.

ATTORNEY-GENERAL BELL has filed a suit in the District Court at Austin, Texas, against plumbing firms in that city which is in the nature of an injunction against the Texas Association of Master Plumbers to restrain them from combining to control the trade in the purchase of plumbing supplies. The defendants named in the suit include 42 names connected with the association of master plumbers, and also the various officers of the association. The petition alleges that two plumbing goods houses in St. Louis have been boycotted for selling material to the Tyler Water Company. In the statement the association is said to be an "illegal, unlawful and injurious combination" in direct violation of the laws of Texas.

GEORGE T. WILSON, a well-known inventor of steam and plumbing appliances, died at his residence, 29 Hudson street, Somerville, Mass., on October 29, aged 55 years. For the past 30 years he had been superintendent in the establishment of Julian D'Este & Co., Boston. He is survived by a wife and nine children.

THE contract for heating and ventilating the new Board of Trade Building, Boston, Mass., has been awarded to Ingalls & Kendriken of that city.

BIDS will be received by L. C. Whitten, chairman of the County Commissioners, until November 12, for heating and ventilating the Penobscot County Court House, at Bangor, Maine.

THE CRANE HAWLEY COMPANY of Cincinnati, Ohio, have gone to some trouble in preparing an elegant exhibit of plumbing goods and fixtures. They recently gave a reception to the local plumbers and architects for the purpose of showing them the handsomest things on the market in the way of Bathtubs, Lavatories, Toilets, Shower Baths and Bathroom Fixtures.

THE GWYNN CENTRAL STATION HEATING COMPANY of Delaware, Ohio, have sent us a copy of a pamphlet devoted to a description of the Gwynn system of heating. The publication contains half-tone engravings of the electric light, heat and power plant in Delaware, Ohio, showing the pumps for distributing hot water through some two miles of street mains, together with pictures of many buildings which are heated from the street mains. It is pointed out that no difficulty has been found in securing 15 cents per square foot of radiation for heating during the year, owing to the ideal service rendered and the absence of labor in handling the fuel and of dust from disposing of the ashes. The advantages of the hot water system are dwelt upon in detail. Special stress is laid on the comfort derived from the even temperature maintained in buildings so heated, owing to the attention at the central station, where the water is heated in accordance with the requirements of the weather and circulated at a higher temperature when the weather is extremely cold, or at a lower temperature when the weather is milder, so that the householder has little or nothing to attend to.

G. W. CHOWN, registrar of Queen's University, Kingston, Ont., will receive bids until November 18 for central heating, power and electric plants for the university and the School of Mining buildings at Kingston.

GEORGE H. STICHTER, Reading, Pa., is equipping the Liberty Dye Works of that city with five water closets and a complete bathroom, together with the necessary draining system. He is also plumbing six houses for Hoff Brothers and putting in a new plumbing system in the Jefferson House for Henry Wise.

THE strike in the plumbing trade in Minneapolis, Minn., has been settled by an arbitration committee.

JOHN HICKMAN of Brockton, Mass., has a contract for the Slate Roofing of the new office building of the Richard Borden Mfg. Company, at Fall River.

THE KNIGHT & JILLSON COMPANY, Indianapolis, Ind., dealers in gas and water supplies and plumbing goods, says the *Sentinel* of that city, deny the report that they have sold their business to the Crane Company of Chicago.

New Firms and Changes.

THE TWENTIETH CENTURY ACETYLENE COMPANY have been incorporated at Buffalo, N. Y., with a capital of \$100,000 by Frank R. Roberts, Joseph B. Roberts and James A. Roberts.

GEORGE GILMAN has purchased the plumbing, tin-smithing and stove business of J. D. Burley, St. Johnsville, N. Y. Mr. Burley contemplates a trip to Jacksonville, Fla., with the idea of conducting a similar business in that place.

THE CHARLOTTE PIPE & FOUNDRY COMPANY, Charlotte, N. C., have been incorporated, with a capital stock of \$10,000, by W. F. Dowd and others.

Closing of the Pan-American Exposition.

The Pan-American Exposition at Buffalo, N. Y., which closed at midnight on Saturday last, was not a financial success. It is estimated that the losses on the fair will approximate \$4,000,000. This loss will fall upon the holders of the common stock, the holders of the second mortgage bonds and the contractors who erected the buildings. The latter, it is said, will lose about \$1,000,000. Most of the concession holders also are understood to have lost money; to some it has meant ruin. The only persons financially interested in the undertaking who will come out without a severe loss are the holders of the first mortgage bonds, who will recover about 80 per cent. of their money. The stock was subscribed for by citizens of Buffalo and its vicinity in small lots of from 1 to 100 \$10 shares. The undertaking, while disastrous to those who backed it, no doubt has been of considerable value to the commercial interests of the country. The total number of admissions for the first six months during which the fair was open was 8,295,173, which was only a little over one-half of the attendance that had been calculated upon by the promoters of the exposition. Several causes probably contributed to the comparative failure of the fair, including the great snow storm of last April, which kept many visitors away, and more particularly the assassination of President McKinley, which proved a severe blow to the interests of the exposition. The gates were closed at that time for two days and when they were reopened there was a drop of 12 per cent. in the attendance, and this falling off was not recovered.

A striking method of advertising was recently adopted by a bicycle agency at Kalgoorlie, Western Australia. They put into their show window a dilapidated wheel bearing this notice: "Worth about £3. No drop in bracket, enamel is ruined, nickel dull, tires punctured, wheels buckled, frame out of line, one crank broken; will be on exhibition again in one week; come around and look at it then." When the people looked into the store window a week afterward they saw the same wheel made "as good as new."

SLATE FOR ROOFING.

In discussing the subject of slate and slate roofing a writer in an exchange makes the following comments which may not be without interest to some of our readers: The most prominent feature of slate is its cleavage along parallel lines. Roofing slate is prepared by splitting the blocks of slate as they come from the quarry into thin slabs. For this purpose a broad, thin chisel is used, and the blocks are split first into two more or less equal parts, each part split through the middle again, and so on until the entire block is divided into slabs of the proper thickness. During this process the edges of the block are kept moist, to facilitate the accurate cleavage of the stone.

After the slates are split to the proper thickness they are trimmed to size by a sort of cleaver process, the cleaving instrument being struck across the plate over a shearing edge on a block. Ordinarily this process is operated by hand power machines which are set to trim the slates to any size desired.

Slates ordinarily occur in such colors as dark blue, bluish black, purple, gray and green. Reddish and lighter yellowish color slates are also occasionally found, but are not as common, and are consequently considerably higher in price for the same quality of slate. Some slates are marked with spots of a different color. For instance, dark purple slates frequently have spots in them of light green. These spots are not injurious to the quality or durability of the slate as a rule, although they mar its appearance.
